CMOS IC

## POWER DISTRIBUTION SWITCH

## ■ DESCRIPTION

The UTC **US3X77** is a power distribution switch and particularly designed for self-powered and bus-powered Universal Serial Bus (USB) applications.

The UTC **US3X77** incorporates protection circuits including current limiting circuit with foldback function, thermal shutdown circuit designed to prevent catastrophic switch failure due to increasing power dissipation when continuous heavy loads or short circuit occurs. Besides, a built-in charge pump is used to drive the N-channel MOSFET that is free of parasitic body diode to eliminate any reversed current flow across the switch when it is powered off.

The  $R_{DS(ON)}$  of the MOSFET switch is as low as  $100\text{m}\Omega$ .  $\overline{\text{OC}}$  is open-drain output report over-current or over-temperature event which has deglitch typical 9ms timeout period typically 9ms.

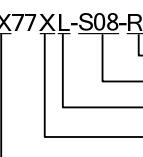

The UTC **US3X77** is applied in high-side power protection switch, USB power management, USB host and self-powered bubs, USB bus-powered hubs, hot plug-in power supplies, battery-charger circuits.

## ■ FEATURES

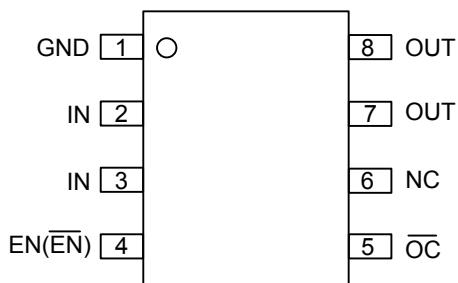

- \*  $100\text{m}\Omega$  High-Side MOSFET
- \* Supply Current:
  - Switch on :  $65\mu\text{A}(\text{Typ})$
  - Switch off :  $1\mu\text{A}$  (Max)
- \* Accurate Current Limit with Foldback
- \* Deglitched Open-Drain Over-Current Flag Output ( $\overline{\text{OC}}$ )
- \* No Reverse Current when Power Off
- \* Under voltage Lockout
- \* Operating Range:  $2.7\text{V} \sim 5.5\text{V}$
- \* Output Shutdown Pull-low Resistor

### ■ PIN CONFIGURATION

### ■ PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	GND	Ground
2, 3	IN	Input Supply: Output MOSFET Drain, which also supplies IC's internal circuitry. Connect to positive supply.
4	EN(EN)	Enable: Logic level enable input. Make sure EN pin never floating.
5	OC	Over-Current: Open-Drain OC output.
6	NC	No connection.
7, 8	OUT	Switch Output: Output MOSFET Source of switch. Typically connect to switched side of load.

### ■ FUNCTIONAL DESCRIPTION

#### OVERCURRENT PROTECTION

When the output load exceeds the current-limit threshold, The Over Current Protection will be triggered. The typical current limit value of UTC **US3077/US3277/US3377/US3477** is 1A, 1.5A, 2A, 2.5A. There is foldback of current limit when short-circuit being encountered.

#### OC RESPONSE

The OC open-drain output is asserted (active low) when an over current or over-temperature shutdown condition is encountered after a 9-ms deglitch timeout. The output remains asserted until the over-current or over-temperature condition is removed.

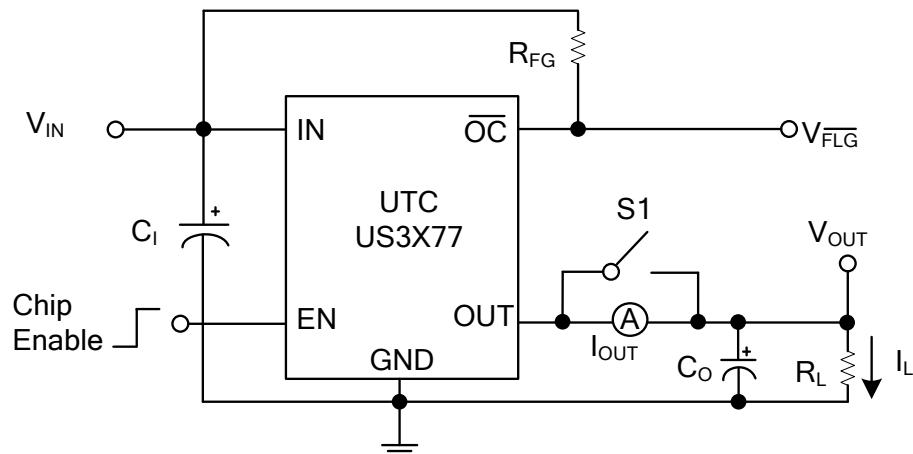

#### THERMAL SHUTDOWN

Thermal shutdown protects UTC **US3X77** from excessive power dissipation. If the die temperature exceeds 135°C, the MOSFET switch is shut off. 20°C of hysteresis prevents the switch from turning on until the die temperature drops to 115°C. Thermal shutdown circuit functions only when the switch is enabled.

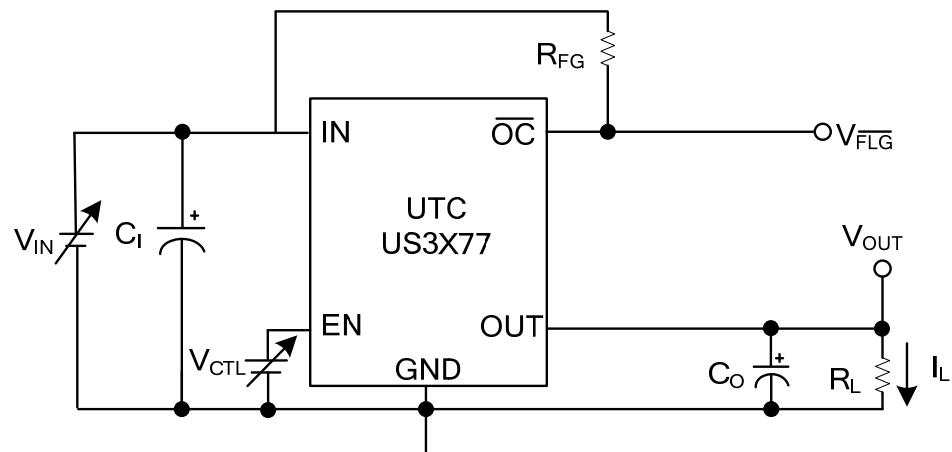

#### UNDERVOLTAGE LOCKOUT (UVLO)

UVLO (under-voltage lockout) prevents the output MOSFET from turning on until IN (input voltage) exceeds 2.5V typically. After the switch turns on, if the voltage drops below 2.3V typically, UVLO shuts off the output MOSFET.

■ TYPICAL APPLICATION CIRCUIT

Note. A low-ESR 150μF aluminum electrolytic or tantalum between V<sub>OUT</sub> and GND is strongly recommended to meet the 330mV maximum droop requirement in the hub V<sub>BUS</sub>.

#### POWER SUPPLY CONSIDERATIONS

A 1μF bypass capacitor on IN pins, a high value capacitor and a 0.1uF bypass capacitor on OUT pins, are strongly recommended, because this precaution can reduce a poor risk that an output short may cause sufficient ringing on the input to damage internal control circuitry.

Input transients must not exceed the absolute maximum supply voltage (6V) even for a short duration.

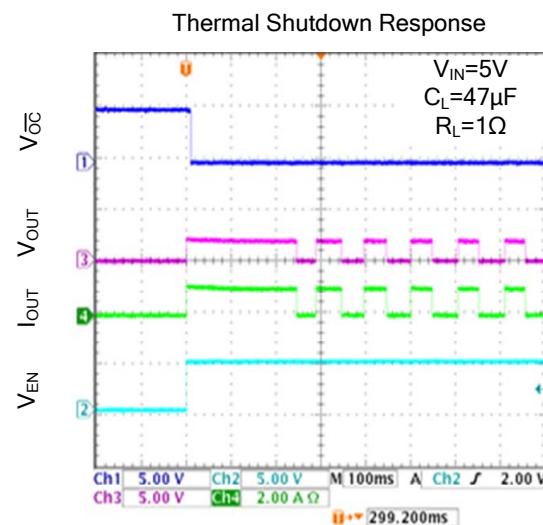

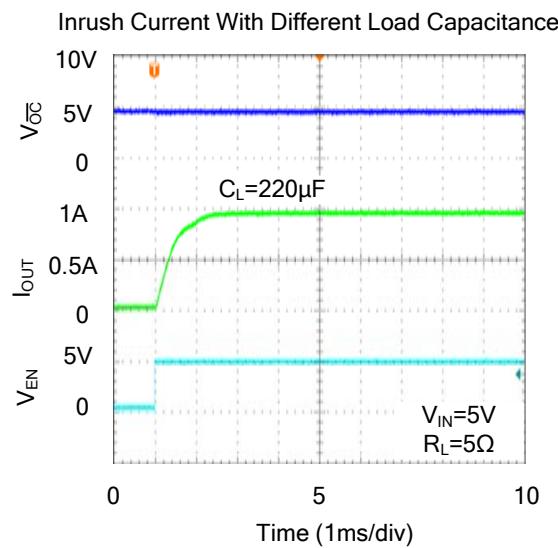

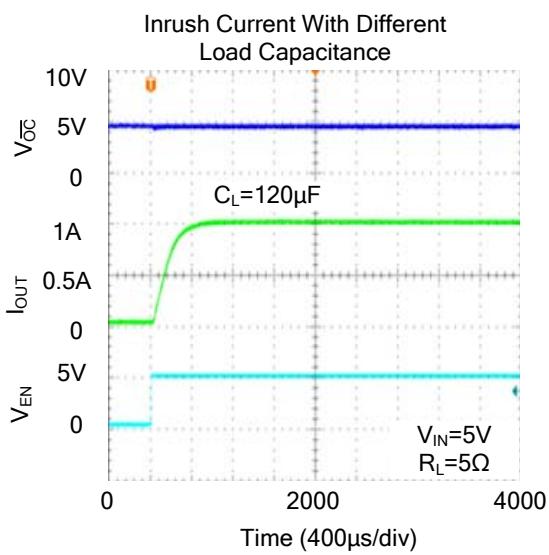

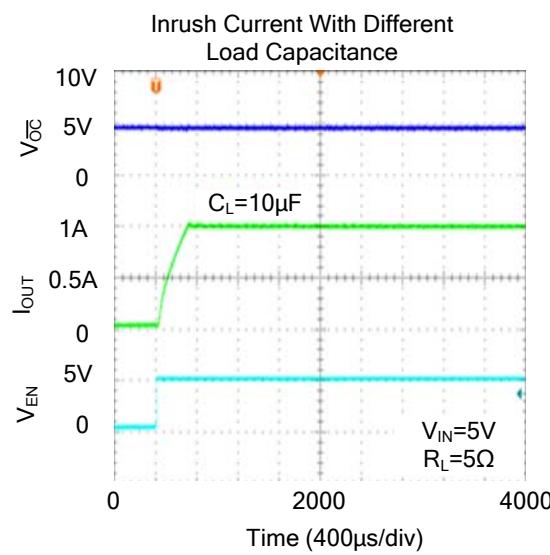

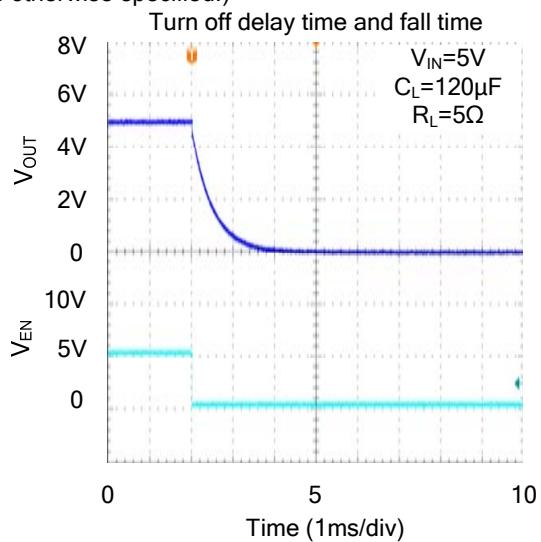

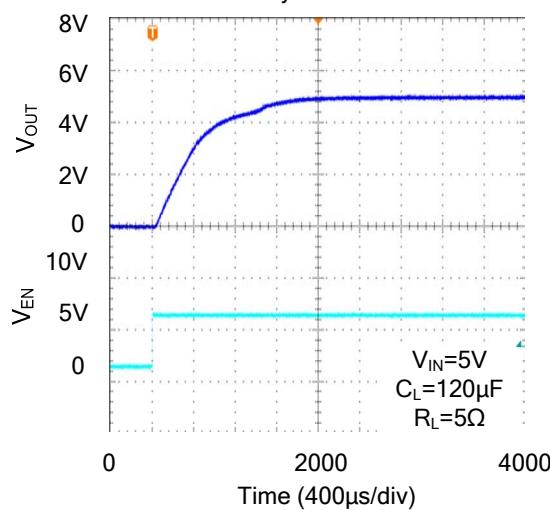

#### ENABLE INPUT

EN must be driven logic high or logic low for a clearly defined input. Floating the input may cause unpredictable operation. EN should not be allowed to go negative with respect to GND.
