

# **MAX1231 Evaluation Kit/ MAX1231 Evaluation System**

---

## **General Description**

The MAX1231 evaluation system (EV system) consists of a MAX1231 evaluation kit (EV kit) and a Maxim 68HC16MODULE-DIP microcontroller ( $\mu$ C) module. The MAX1231 is a 12-bit, 300ksps analog-to-digital converter (ADC) with an internal temperature sensor, first-in/first-out (FIFO), and an internal reference. The evaluation software runs under Windows® 95/98/2000, providing a handy user interface to exercise the MAX1231 features.

Order the complete EV system (MAX1231EVC16) for comprehensive evaluation of the MAX1231 using a personal computer. Order the EV kit (MAX1231EVKIT) if the 68HC16MODULE module has already been purchased with a Maxim EV system, or for custom use in other  $\mu$ C-based systems.

This system can also evaluate the MAX1030, MAX1031, and MAX1230. Contact the factory for free samples of these products. See the *Detailed Description of Hardware* section.

---

## **MAX1231 Stand-Alone EV Kit**

The MAX1231 EV kit provides a proven PC board layout to facilitate evaluation of the MAX1231. It must be interfaced to appropriate timing signals for proper operation. Connect 3V and ground return to terminal block TB1 (Figure 5). Refer to the MAX1227/MAX1229/MAX1231 data sheet for timing requirements.

---

## **MAX1231 EV System**

The MAX1231 EV system operates from a user-supplied 7VDC to 20VDC power supply. The evaluation software runs under Windows 95/98/2000 on an IBM PC, interfacing to the EV system board through the computer's serial communications port. See the *Quick Start* section for setup and operating instructions.

---

## **Features**

- ◆ Proven PC Board Layout
- ◆ Complete Evaluation System
- ◆ Convenient On-Board Test Points
- ◆ Data-Logging Software
- ◆ Fully Assembled and Tested

---

## **Ordering Information**

PART	TEMP RANGE	INTERFACE TYPE
MAX1231EVKIT	0°C to +70°C	User supplied
MAX1231EVC16	0°C to +70°C	Windows software

**Note:** The MAX1231 evaluation software is designed for use with the complete evaluation system MAX1231EVC16 (includes the 68HC16MODULE-DIP module together with the MAX1231EVKIT). If the MAX1231 evaluation software is not to be used, the MAX1231EVKIT can be purchased by itself, without the  $\mu$ C.

---

# MAX1231 Evaluation Kit/ MAX1231 Evaluation System

## MAX1231EVKIT Component List

DESIGNATION	QTY	DESCRIPTION
C1-C16	16	0.01µF ±10% ceramic capacitors (1206)
C17	1	0.1µF ceramic capacitor (1206)
C18	1	10µF ±20%, 6.3V X5R ceramic capacitor (0805) TDK C2012X5R0J106M
H1	1	7-pin header
J1	1	2 x 20 right-angle socket
JU1 2-3	1	Shunt
JU1	1	3-pin header
JU2	0	Shorted trace on PC board
R1-R16	16	10Ω ±5% resistors (1206)
TB1	1	2-circuit terminal block, 5.08mm pitch
TB2-TB5	4	5-circuit terminal blocks, 5.08mm pitch
U1	1	MAX1231BCEG-T (24-pin QSOP)
U2	1	MAX1615EUK-T, ABZD, (5-pin SOT23)
U3, U4	2	MAX1840EUB (10-pin µMAX) or MAX1841EUB
None	1	MAX1231 evaluation kit PC board

## Quick Start

### Required Equipment

Before you begin, you need the following equipment:

- MAX1231EVC16 (contains the MAX1231EVKIT and the 68HC16MODULE-DIP)
- DC power supply, +7VDC to +20VDC at 0.25A
- Windows 95/98/2000 computer with a spare serial (COM) port
- 9-pin I/O extension cable

### Procedure

Do not turn on the power until all connections are made:

- 1) Ensure that JU1 is in the 2-3 position (Table 2).
- 2) Carefully connect the boards by aligning the 40-pin header of the MAX1231 EV kit with the 40-pin connector of the 68HC16MODULE-DIP module. Gently press them together. The two boards should be flush against one another.

**Note:** Bold items are software settings or commands.

- 3) Connect a +7VDC to +20VDC power source to the µC module at the terminal block located next to the on/off switch, along the top edge of the µC module. Observe the polarity marked on the board.
- 4) Connect a cable from the computer's serial port to the µC module. If using a 9-pin serial port, use a straight-through, 9-pin female-to-male cable. If the only available serial port uses a 25-pin connector, a standard 25-pin to 9-pin adapter is required. The EV kit software checks the modem status lines (CTS, DSR, DCD) to confirm that the correct port has been selected.
- 5) Install the evaluation software on your computer by running the INSTALL.EXE program on the floppy disk. The program files are copied and icons are created for them in the Windows start menu.
- 6) Turn on the power supply.
- 7) Start the MAX1231 program by opening its icon in the start menu.
- 8) The program prompts you to connect the µC module and turn its power on. Slide SW1 to the ON position. Select the correct serial port, and click OK. The program automatically downloads its software to the module.
- 9) Apply an input signal to AIN0 and click **Perform Action**. Observe the readout on the screen. To perform the action repeatedly, check the **every 200ms** box.
- 10) To view a graph of the measurements, pull down the **View** menu and click **Graph**.

## Detailed Software Description

The evaluation software's main window configures the data converter and measures the analog inputs. Under **Action**, select a scanning sequence, repetitive conversions, or a single conversion. Each selected channel's measurement results are displayed in the corresponding **Measurement Results** field.

The **Action** setting **read single channel repeatedly** requires making a selection under **Repetition** to determine how many times the selected channel should be measured.

Use **Averaging** to summarize a series of measurement results on each selected channel as an arithmetic mean value. Repetition can be used together with **Averaging** to summarize a large number of measurement results as a small number of sample means.

# **MAX1231 Evaluation Kit/ MAX1231 Evaluation System**

The **Low-Level Interface Details** panel shows the most recent low-level register write. A summary of what has been written to each register is available under the **Low-level registers** tab.

The AIN14 and AIN15 channels are automatically skipped if their alternate functions are selected in the setup register. The evaluation software updates its display to show or hide these channels whenever the alternate functions are enabled or disabled.

The **Setup** tab configures the alternate functions for the AIN14 and AIN15 pins, and also configures adjacent channels as differential input pairs.

The **Low-level registers** tab summarizes the commands that create the active configuration. The **Reset All Registers** button resets these software-shadowed register values and sends the reset command to the MAX1231.

**Table 1. Graph Tool Buttons**

TOOL	FUNCTION
	Show the entire available input range.
	Expand the graph data to fill the window.
	Move the view left or right.
	Move the view up or down.
	Expand or contract the x-axis.
	Expand or contract the y-axis.
	Load data from a file.
	Save data to a file.
	Option to write a header line when saving data.
	Option to write line numbers when saving data.
	View code vs. time plot.
	View histogram plot (cumulative frequency of each code).
	View table.
	Show minimum in tabular view.
	Show maximum in tabular view.
	Show span in tabular view. Span = maximum - minimum
	Show number of samples in tabular view.
	Show sum of the samples in tabular view.
	Show sum of the squares of the samples in tabular view.
	Show arithmetic mean in tabular view: $\text{Mean} = \frac{\sum(x)}{n}$

TOOL	FUNCTION
	Show standard deviation in tabular view: $\text{Standard deviation} = \sqrt{\frac{n\sum(x^2) - (\sum x)^2}{(n-1)n}}$
	Show root of the mean of the squares (RMS) in tabular view: $\text{RMS} = \sqrt{\frac{\sum(x^2)}{n}}$
	Channel 0 enable
	Channel 1 enable
	Channel 2 enable
	Channel 3 enable
	Channel 4 enable
	Channel 5 enable
	Channel 6 enable
	Channel 7 enable
	Channel 8 enable
	Channel 9 enable
	Channel 10 enable
	Channel 11 enable
	Channel 12 enable
	Channel 13 enable
	Channel 14 enable

# MAX1231 Evaluation Kit/ MAX1231 Evaluation System

## Sampling

Measurement data can be sampled in external clock mode. From the **Setup** tab, set **Clock Mode** to **0111xxxx ext clock**. Then, return to the **Measurement** tab and click **Get Samples**.

## Graph Window

To view recently measured data, drop down the **View** menu and choose **Graph**. Data can be viewed as a time sequence plot, a histogram plot, or as a table of raw numbers. See Table 1 for available graph commands.

## Diagnostics Window

The diagnostics window is used for factory testing prior to shipping the evaluation kit. It is not meant for customer use.

## Detailed Hardware Description

The MAX1231 device under test (U1) is a 12-bit, 300ksps ADC with an internal temperature sensor, FIFO, and an internal reference. Resistors R1–R16 and capacitors C1–C16 form single-pole, lowpass, anti-aliasing filters for each input. Capacitor C17 provides power-supply bypassing for U1 (Figure 5). Refer to the MAX1227/MAX1229/MAX1231 data sheet.

The EV kit includes a MAX1615 3V/5V linear regulator (U2) and a set of MAX1840/MAX1841 level shifters (U3 and U4) to support using the 3V MAX1230 with the 5V µC.

## Evaluating the MAX1030

The MAX1030 is the 5V, 10-bit version of the MAX1231. To evaluate the MAX1030, request a free sample of MAX1030BCEG. Replace U1 with a MAX1030, and move JU1 shunt to the 5V position. In the software's **Options** menu, select **Reference** = 4.096V.

The evaluation software expects 12 bits of data, but the MAX1030 only provides 10 bits of meaningful data. Because the most significant bits are aligned, the measurement code numbers reported by the software are four times the actual measurement code number. Reconstructed voltage values are unaffected. Adjust the graph window by selecting its **Options** menu; set its **Sub-LSBs** to **2**.

## Evaluating the MAX1031

The MAX1031 is the 10-bit version of the MAX1231. To evaluate the MAX1031, request a free sample of the MAX1031BCEG. Replace U1 with a MAX1031, and move the JU1 shunt to the 3V position.

The evaluation software expects 12 bits of data, but the MAX1031 only provides 10 bits of meaningful data. Because the most significant bits are aligned, the measurement code numbers reported by the software are

four times the actual measurement code number. Reconstructed voltage values are unaffected. Adjust the graph window by selecting its **Options** menu; set its **Sub-LSBs** to **2**.

## Evaluating the MAX1230

The MAX1230 is the 5V version of the MAX1231. To evaluate the MAX1230, request a free sample of the MAX1230BCEG. Replace U1 with a MAX1230, and move the shunt to the 5V position. In the software's **Options** menu, select **Reference** = 4.096V.

## Using an External Reference

An external reference can be applied in single-ended or differential mode. In differential mode, analog input pin AIN14 is used as the REF(-) return connection. In single-ended mode, the reference returns to common ground.

With the power off, connect the external reference. Then power up the system and run the evaluation software. Under **Setup**, select the appropriate reference input configuration. If using a single-ended reference, set **Reference Input** to **01xx01xx pin15 = AIN14**. If using a differential reference, set **Reference Input** to **01xx11xx pin 15 = REF-**.

**Table 2. Jumper JU1 (V<sub>DD</sub> Voltage Selection)**

SHUNT POSITION	V <sub>DD</sub> (V)	FUNCTION
1–2	5V	Normal operation with U1 = MAX1230 or MAX1030.
2–3*	3V	Normal operation with U1 = MAX1231 or MAX1031.
Open	Unspecified	Do not operate kit with JU1 open.

\*Indicates default configuration.

**Table 3. Optional Jumper JU2 (AIN15 Alternate Function)**

JU2 STATE	U1 PIN 16 CONNECTION	FUNCTION
Closed* (default trace on PC board)	Connected to µC module J1 pin 29 (through level shifter)	U1 pin 16 = CNVST conversion start command. Leave TB5 pin 4 unconnected.
Open	Connected to TB5 pin 4	U1 pin 16 = AIN15 analog input. Connect signal source to terminal block TB5 pin 4.

\*Indicates default configuration.

# **MAX1231 Evaluation Kit/ MAX1231 Evaluation System**

## **Troubleshooting**

**Problem:** No output measurement. System seems to report zero voltage or fails to make a measurement.

**Solution:** Check VDD supply voltage. Check the reference voltage using a digital voltmeter. Use an oscilloscope to verify that the conversion-start signal is being strobed.

**Problem:** Measurements are erratic, unstable, or have poor accuracy.

**Solution:** Check the reference voltage using a digital voltmeter. Use an oscilloscope to check for noise. When probing for noise, keep the oscilloscope ground return lead as short as possible, preferably less than 0.5in (10mm).

**Problem:** Unacceptable errors occur when measuring a transducer.

**Solution:** Although most signal sources can be connected directly to the MAX1231's analog inputs, some high-impedance signal sources can require an input buffer. Check for settling errors by increasing the acquisition time (internal clock mode 01). If necessary, use a MAX4430 to buffer high-impedance signal sources.

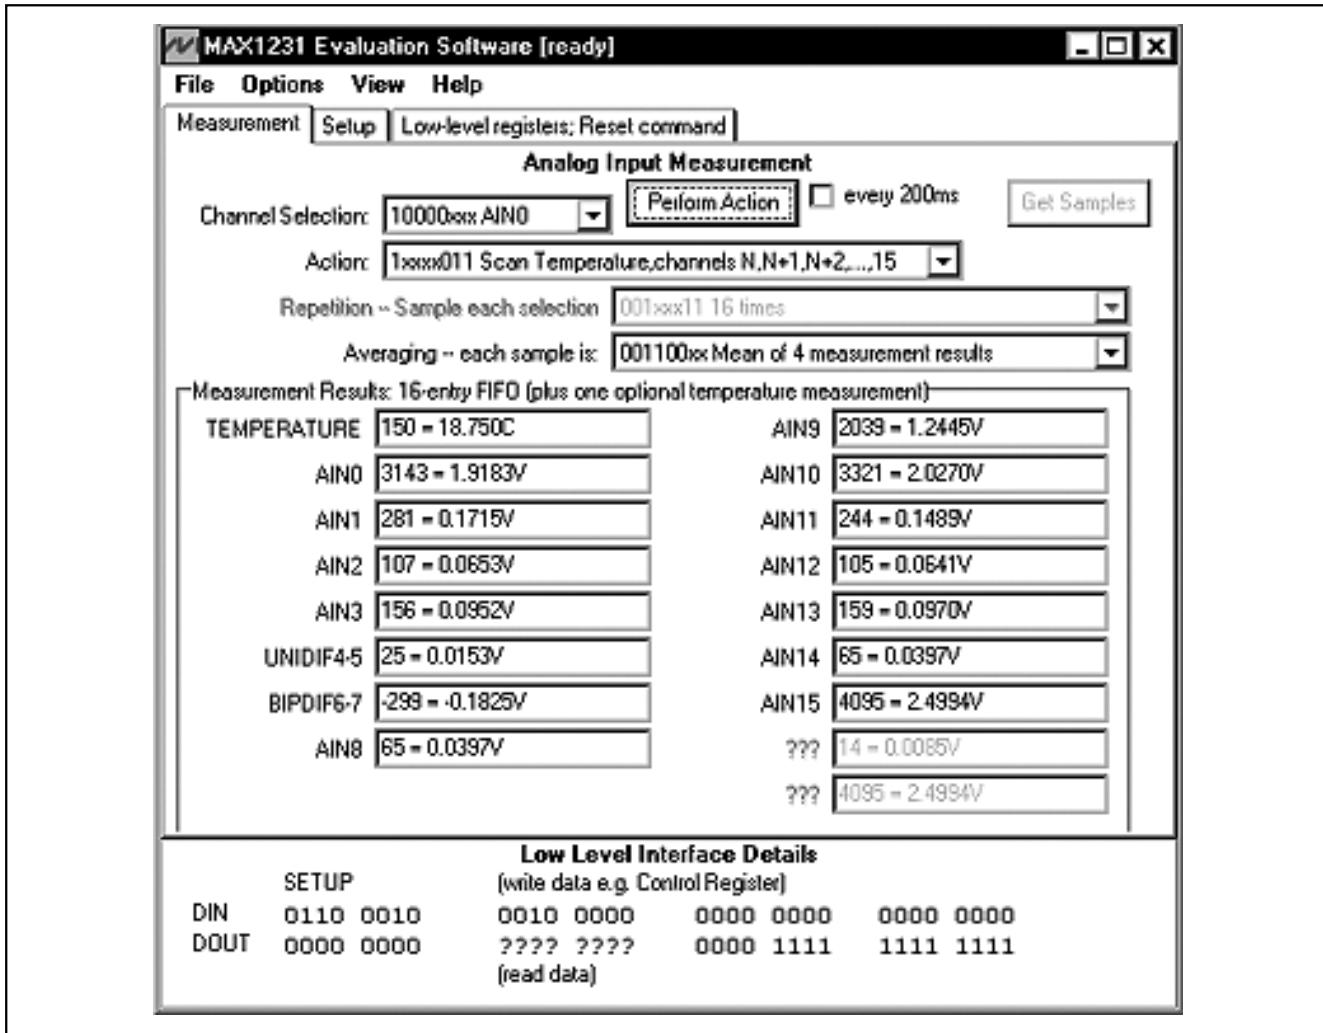

Figure 1. The MAX1231 evaluation software's main window configures the data converter and measures the analog inputs.
