

Features

- High-performance, Low-power AVR[®] 8-bit Microcontroller
- Advanced RISC Architecture
 - 133 Powerful Instructions – Most Single Clock Cycle Execution
 - 32 x 8 General Purpose Working Registers + Peripheral Control Registers
 - Fully Static Operation
 - Up to 16 MIPS Throughput at 16 MHz
 - On-chip 2-cycle Multiplier
- Non volatile Program and Data Memories
 - 128K Bytes of In-System Reprogrammable Flash
 - Endurance: 10,000 Write/Erase Cycles
 - Optional Boot Code Section with Independent Lock Bits
 - Selectable Boot Size: 1K Bytes, 2K Bytes, 4K Bytes or 8K Bytes
 - In-System Programming by On-Chip Boot Program (CAN, UART)
 - True Read-While-Write Operation
 - 4K Bytes EEPROM (Endurance: 100,000 Write/Erase Cycles)
 - 4K Bytes Internal SRAM
 - Up to 64K Bytes Optional External Memory Space
 - Programming Lock for Software Security
- JTAG (IEEE std. 1149.1 Compliant) Interface
 - Boundary-scan Capabilities According to the JTAG Standard
 - Programming Flash (Hardware ISP), EEPROM, Lock & Fuse Bits
 - Extensive On-chip Debug Support
- CAN Controller 2.0A & 2.0B
 - 15 Full Message Objects with Separate Identifier Tags and Masks
 - Transmit, Receive, Automatic Reply and Frame Buffer Receive Modes
 - 1Mbits/s Maximum Transfer Rate at 8 MHz
 - Time stamping, TTC & Listening Mode (Spying or Autobaud)
- Peripheral Features
 - Programmable Watchdog Timer with On-chip Oscillator
 - 8-bit Synchronous Timer/Counter-0
 - 10-bit Prescaler
 - External Event Counter
 - Output Compare or 8-bit PWM Output
 - 8-bit Asynchronous Timer/Counter-2
 - 10-bit Prescaler
 - External Event Counter
 - Output Compare or 8-Bit PWM Output
 - 32Khz Oscillator for RTC Operation
 - Dual 16-bit Synchronous Timer/Counters-1 & 3
 - 10-bit Prescaler
 - Input Capture with Noise Canceler
 - External Event Counter
 - 3-Output Compare or 16-Bit PWM Output
 - Output Compare Modulation
 - 8-channel, 10-bit SAR ADC
 - 8 Single-ended channels
 - 7 Differential Channels
 - 2 Differential Channels With Programmable Gain at 1x, 10x, or 200x
 - On-chip Analog Comparator
 - Byte-oriented Two-wire Serial Interface
 - Dual Programmable Serial USART
 - Master/Slave SPI Serial Interface
 - Programming Flash (Hardware ISP)
- Special Microcontroller Features
 - Power-on Reset and Programmable Brown-out Detection
 - Internal Calibrated RC Oscillator
 - 8 External Interrupt Sources
 - 5 Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down & Standby
 - Software Selectable Clock Frequency
 - Global Pull-up Disable
- I/O and Packages
 - 53 Programmable I/O Lines
 - 64-lead TQFP and 64-lead QFN
- Operating Voltages
 - 2.7 - 5.5V
- Operating temperature
 - Industrial (-40°C to +85°C)
- Maximum Frequency
 - 8 MHz at 2.7V - Industrial range
 - 16 MHz at 4.5V - Industrial range

8-bit AVR[®] Microcontroller with 128K Bytes of ISP Flash and CAN Controller

AT90CAN128

Summary

Rev. 4250ES-CAN-12/04

Note: This is a summary document. A complete document is available on our web site at www.atmel.com.

Description

The AT90CAN128 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the AT90CAN128 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

The AVR core combines a rich instruction set with 32 general purpose working registers. All 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The AT90CAN128 provides the following features: 128K bytes of In-System Programmable Flash with Read-While-Write capabilities, 4K bytes EEPROM, 4K bytes SRAM, 53 general purpose I/O lines, 32 general purpose working registers, a CAN controller, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, 2 USARTs, a byte oriented Two-wire Serial Interface, an 8-channel 10-bit ADC with optional differential input stage with programmable gain, a programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and five software selectable power saving modes.

The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI/CAN ports and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel AT90CAN128 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The AT90CAN128 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

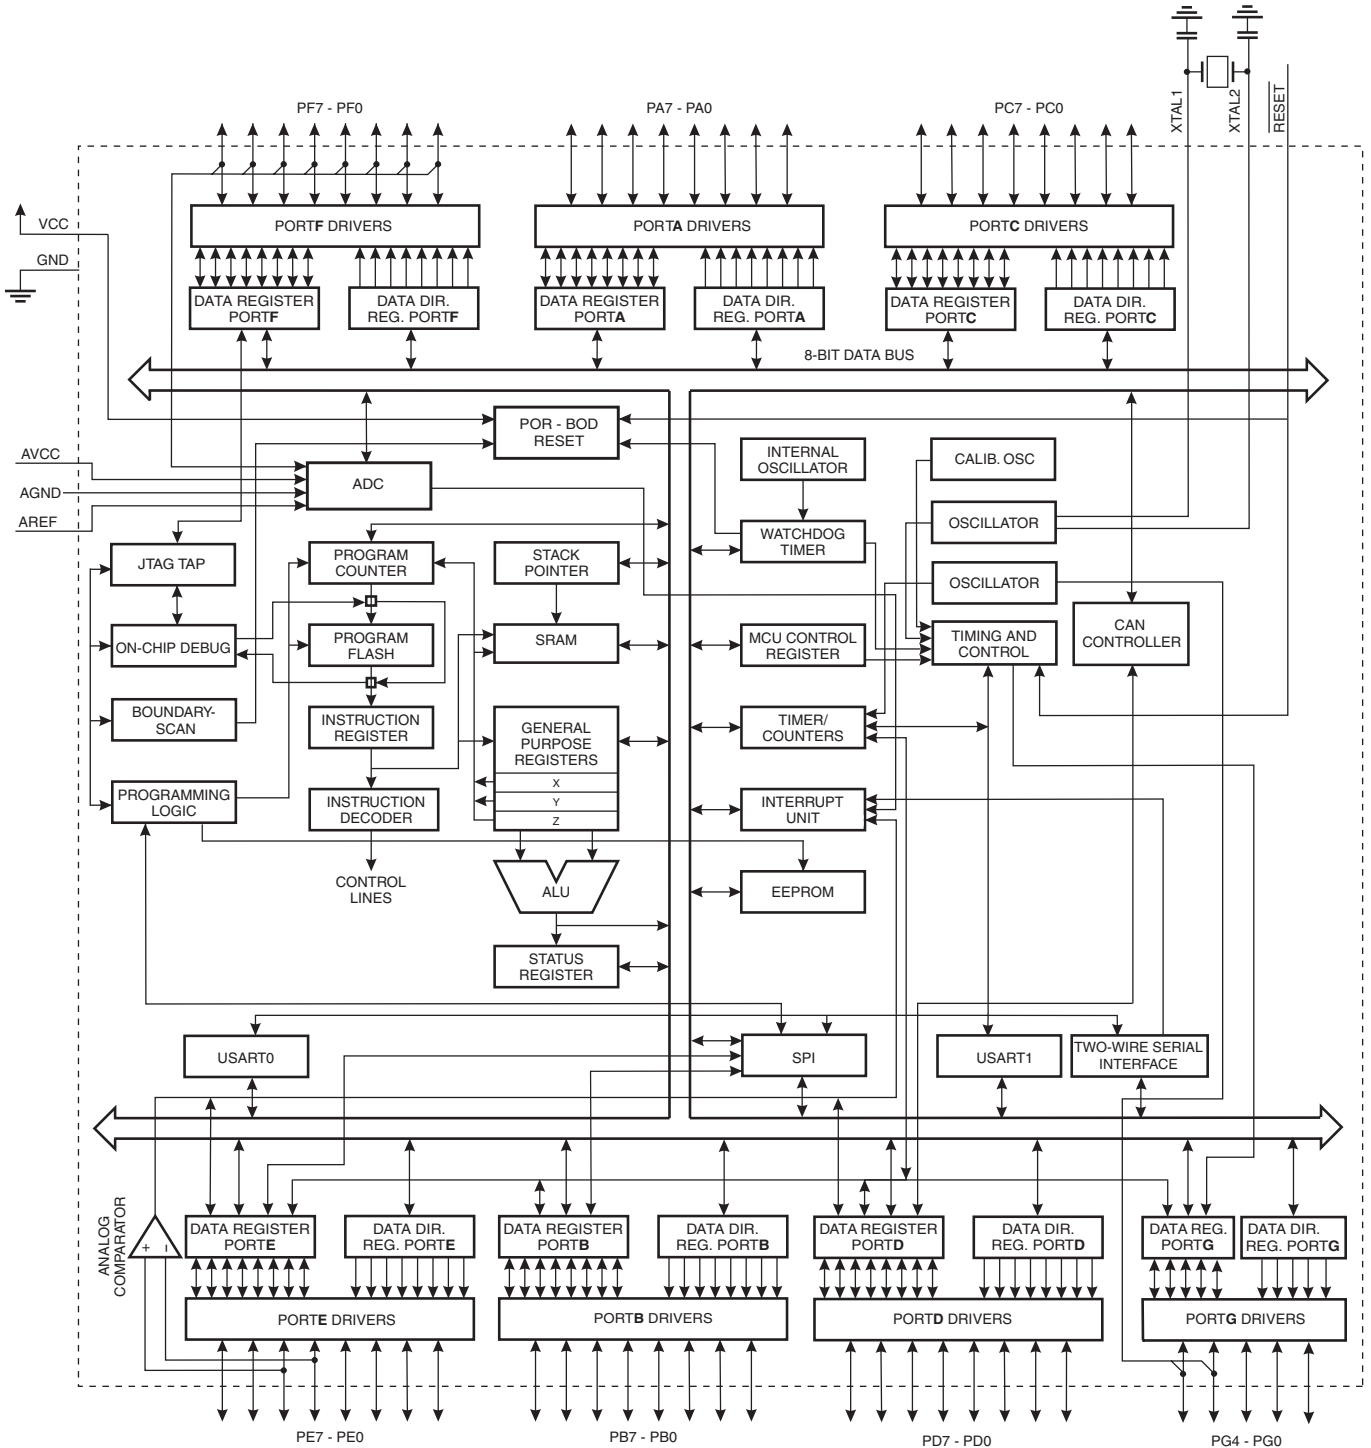

Applications that use the ATmega128 AVR microcontroller can be made compatible to use the AT90CAN128, refer to Application Note AVR 096, on the Atmel web site.

Disclaimer

Typical values contained in this datasheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min and Max values will be available after the device is characterized.

Pin Descriptions

| | |
|--------------------------|--|
| VCC | Digital supply voltage. |
| GND | Ground. |
| Port A (PA7..PA0) | <p>Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port A also serves the functions of various special features of the AT90CAN128 as listed on page 70.</p> |
| Port B (PB7..PB0) | <p>Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port B also serves the functions of various special features of the AT90CAN128 as listed on page 72.</p> |
| Port C (PC7..PC0) | <p>Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port C also serves the functions of special features of the AT90CAN128 as listed on page 74.</p> |
| Port D (PD7..PD0) | <p>Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port D also serves the functions of various special features of the AT90CAN128 as listed on page 77.</p> |
| Port E (PE7..PE0) | <p>Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port E also serves the functions of various special features of the AT90CAN128 as listed on page 79.</p> |
| Port F (PF7..PF0) | <p>Port F serves as the analog inputs to the A/D Converter.</p> <p>Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up</p> |

resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port F also serves the functions of the JTAG interface. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a reset occurs.

Port G (PG4..PG0)

Port G is a 5-bit I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features of the AT90CAN128 as listed on page 84.

RESET

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset. The minimum pulse length is given in characteristics. Shorter pulses are not guaranteed to generate a reset. The I/O ports of the AVR are immediately reset to their initial state even if the clock is not running. The clock is needed to reset the rest of the AT90CAN128.

XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

XTAL2

Output from the inverting Oscillator amplifier.

AVCC

AVCC is the supply voltage pin for the A/D Converter on Port F. It should be externally connected to V_{CC} , even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.

AREF

This is the analog reference pin for the A/D Converter.

About Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. These code examples assume that the part specific header file is included before compilation. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

- Note:
1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
 2. I/O Registers within the address range 0x00 - 0x1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
 3. Some of the status flags are cleared by writing a logical one to them. Note that, unlike most other AVRs, the CBI and SBI instructions will only operate on the specified bit, and can therefore be used on registers containing such status flags. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
 4. When using the I/O specific commands IN and OUT, the I/O addresses 0x00 - 0x3F must be used. When addressing I/O Registers as data space using LD and ST instructions, 0x20 must be added to these addresses. The AT90CAN128 is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from 0x60 - 0xFF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

Ordering Information

| Ordering Code | Speed (MHz) | Power Supply (V) | Package | Operation Range | Product Marking |
|-----------------|-------------|------------------|---------|-------------------------------------|-----------------|
| AT90CAN128-16AI | 16 | 2.7 - 5.5 | 64A | Industrial (-40° to +85°C) | AT90CAN128-IL |
| AT90CAN128-16MI | 16 | 2.7 - 5.5 | 64M1 | Industrial (-40° to +85°C) | AT90CAN128-IL |
| AT90CAN128-16AU | 16 | 2.7 - 5.5 | 64A | Industrial (-40° to +85°C) Green | AT90CAN128-UL |
| AT90CAN128-16MU | 16 | 2.7 - 5.5 | 64M1 | Industrial (-40° to +85°C) Green | AT90CAN128-UL |

Note: This device can also be supplied in wafer form. Please contact your local Atmel sales office for detailed ordering information and minimum quantities.

Packaging Information

| Package Type | |
|--------------|---|
| 64A | 64-Lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP) |
| 64M1 | 64-Lead, Quad Flat No lead (QFN) |

TQFP64

64 LEADS Thin Quad Flat Package

- Notes:
1. This package conforms to JEDEC reference MS-026, Variation AEB.
 2. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25 mm per side. Dimensions D1 and E1 are maximum plastic body size dimensions including mold mismatch.
 3. Lead coplanarity is 0.10 mm maximum.
