

# 32-bit RISC Microcontroller

CMOS

## FR50 Family MB91360G Series

# MB91FV360GA/F361GA/F362GA

### ■ DESCRIPTION

The Fujitsu MB91360G series is a standard microcontroller containing a wide range of I/O peripherals and bus control functions. The MB91360G series features a 32-bit RISC CPU (FR50 series) core and is suitable for embedded control applications requiring high-performance and high-speed CPU processing. The MB91360G series also contains up to 4 Kbyte instruction cache memory and other internal memories to improve the execution speed of the CPU.

### ■ FEATURES

- Execution time : down to 15.6 ns (64 MHz)
- FR50 series CPU : RISC architecture

The CPU has a general-purpose register architecture with improved numeric implementation whereby a wide range of delayed branch instructions reduces losses in execution time due to pipeline breaks.

Bit manipulation instructions and memory access instructions have been enhanced resulting in improved code efficiency and execution speed for control implementation.

- A five-stage pipeline structure provides high-speed processing (one instruction per cycle)
- 32-bit linear address space : 4 Gbytes
- Fixed 16-bit instruction size (basic instructions)
- High-speed multiplication/step division
- High-speed interrupt processing (6 cycles)
- General-purpose registers : 16 × 32 bits

(Continued)

### ■ PACKAGE

401-pin Ceramics PGA

(PGA-401C-A02)

208-pin plastic QFP

(FPT-208P-M04)

# MB91360G Series

(Continued)

- **External bus interface unit with a wide range of functions**

Divides the external memory space into a maximum of eight areas. Chip select signal setting, data bus width selection (8, 16, 32-bit) , and area size can be specified for each area.

- Address bus up to 32 bit wide
- Programmable auto-wait function

- **Internal instruction cache**

The MB91360G series contains up to 4-Kbyte instruction cache to improve the execution speed of external programs.

- Two-way set associative caching

- **DMAC**

Direct memory access (DMA) can be used to perform various types of data transfer without going via the CPU. This improves system performance.

- Eight channels (including up to 3 external channels)
- Three transfer modes supported : single/block, burst, continuous transfer

- **Power consumption control mechanisms**

The MB91360G series contains a number of functions for controlling the operating clock to reduce power consumption.

- Software control : Sleep and stop/real time clock functions
- Hardware control : Hardware standby function
- Gear (divider) function : The CPU and peripheral clock frequencies can be set independently.

- **Contains a range of peripheral functions**

- UART, U-timer
- Real Time Clock (with optional subclock operation and subclock calibration module)
- Stepper Motor Control
- Sound Generator
- Serial IO (SIO) , SIO-Prescaler
- Power Down Reset
- Alarm Comparator
- IO-Timer
- I<sup>2</sup>C Interface
- 10 Bit D/A Converter
- CAN Interface
- 10-bit A/D converter
- 16-bit reload timer
- 16-bit PWM timer
- Watchdog timer
- Bit search module
- Interrupt controller
- External interrupt inputs
- I/O port function

- **Interrupt levels**

“16 maskable interrupt levels”

- **Other**

- Power supply voltage
- 5 V power supply used, the internal regulator creates internal supply of 3.3 V
- Package : MB91FV360GA uses a PGA401 package, MB91F361GA and MB91F362GA are delivered in a QFP208 package.

R : Diffusion resistor

# MB91360G Series

Circuit Type	Description
A	I/O, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , CMOS Automotive Schmitt-Trigger Input, STOP control
B	I/O, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , CMOS Automotive Schmitt-Trigger Input, Analog Input, STOP control
C	Analog Output
D	Analog Input
E	CMOS Schmitt-Trigger Input, Pull-up Resistor: $50 \text{ k}\Omega$ ,
F	CMOS Schmitt-Trigger Input
G	Tristate Output, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$
H	4 MHz Oscillator Pin
I	32 kHz Oscillator pin
J	I/O, $I_{OH} = 14 \text{ mA}$ / $I_{OL} = 24 \text{ mA}$ , CMOS Automotive Schmitt-Trigger Input, STOP control (LED)
K	I/O, $I_{OH} = 30 \text{ mA}$ / $I_{OL} = 30 \text{ mA}$ , CMOS Automotive Schmitt-Trigger Input, STOP control, slew rate improved for EMC (SMC)
L	I/O, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , CMOS Input; 5 V or 3 V input
M	I/O, $I_{OH} = 30 \text{ mA}$ / $I_{OL} = 30 \text{ mA}$ , CMOS Automotive Schmitt-Trigger Input, Analog Input, STOP control, slew rate improved for EMC (SMC)
N	I/O, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , CMOS Input, Pulldown Resistor: $50 \text{ k}\Omega$ ,; 5 V or 3 V input
O	CMOS Input, Pulldown Resistor: $50 \text{ k}\Omega$ ,; 5 V or 3 V input
P	CMOS Input; 3 V input
Q	I/O, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , CMOS Input, STOP control
R	AVRL / AVRH Input
S	I/O, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , CMOS Input, STOP control, Pull-up Resistor: $10 \text{ k}\Omega$ ,
T	CMOS Input, can withstand $V_{ID}$ for flash programming
U	CMOS Schmitt-Trigger Input, Pull-up Resistor: $50 \text{ k}\Omega$ ,, 3.3 V and 5 V inputs to core
W	I/O, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , CMOS Input; 3 V input
X	Tristate Output, $I_{OH} = 4 \text{ mA}$ / $I_{OL} = 4 \text{ mA}$ , 3 V
Y	I/O, $I_{OH} = 3 \text{ mA}$ / $I_{OL} = 3 \text{ mA}$ (I <sup>2</sup> C) , CMOS Input, STOP control

## ■ HANDLING DEVICES

### 1. Preventing latch-up

Latch-up may occur in a CMOS IC if a voltage greater than  $V_{DD}$  or less than  $V_{SS}$  is applied to an input or output pin or if the voltage applied between  $V_{DD}$  and  $V_{SS}$  exceeds the rating. If latch-up occurs, the power supply current increases rapidly resulting in thermal damage to circuit elements. Therefore, ensure that maximum ratings are not exceeded in circuit operation.

### 2. Connecting unused pins

Leaving unused input pins open may result in misbehavior or latch up and possible permanent damage of the device. Therefore they must be tied to  $V_{DD}$  or  $V_{SS}$  through resistors. In this case those resistors should be more than 2 K $\Omega$ m.

Unused bidirectional pins should be set to the output state and can be left open, or the input state with the above described connection.

The resistor of more than 2 K $\Omega$ m is used to limit currents through the protection diodes. In case of voltages at the not used pin of 0.3 V or more below  $V_{SS}$  or 0.3 V or more above  $V_{DD}$  currents which could cause latch-up will flow through those diodes.

### 3. External reset input

When inputting an “L” level to the  $\overline{INIT}$  pin, hold this low level at the  $\overline{INIT}$  pin long enough so that after release of the low level at  $\overline{INIT}$  and the passing of the built in waiting time stable oscillation of the oscillation circuit is achieved.  $\overline{INIT}$  must be pulled low for at least 8 cycles of the 4 MHz oscillation clock.

### 4. Power supply pins

All  $V_{DD}$  pins should be connected to the same potential (exception can be the external bus interface on F361GA and F362GA) . The analogue supply voltage ( $AV_{CC}$ ) must not be turned on before the digital supply voltage. If the external bus interface is supplied with 3.3 V this voltage also must not be turned on before the 5 V digital voltage has been switched on. If the supply voltage to the external bus interface is switched off (it may not be tristate but should be pulled low) it must be made sure that all related signals do not have a voltage higher than this pulled down supply.

When multiple  $V_{DD}$  and  $V_{SS}$  pins are provided, be sure to connect all  $V_{DD}$  and  $V_{SS}$  pins to the power supply or ground externally. Although pins at the same potential are connected together in the internal device design so as to prevent malfunctions such as latch-up, connecting all  $V_{DD}$  and  $V_{SS}$  pins appropriately minimizes unwanted radiation, prevents malfunction of strobe signals due to increases in the ground level, and keeps the overall output current rating.

Also, take care to connect  $V_{DD}$  and  $V_{SS}$  to current source in the lowest possible impedance.

Connection of a ceramic bypass capacitor of approximately 0.1  $\mu$ F between  $V_{DD}$  and  $V_{SS}$  close to the device is recommended.

The MB91360G series contains a regulator. To use the device with the 5-V power supply, supply 5-V power to the  $V_{CC}$  pins and be sure to connect a bypass capacitor of 10  $\mu$ F parallel to 10 nF to the  $V_{CC3C}$  pin for the regulator.

# MB91360G Series

## 5. Crystal oscillator circuit

Noise in the vicinity of the X0 and X1 pins can be a cause of device malfunction. Design the circuit board so that X0, X1, the crystal oscillator (or ceramic oscillator) , and the bypass capacitor to ground are located as close to the device as possible.

A printed circuit board design that surrounds the X0 and X1 pins with ground provides for stable operation and is strongly recommended.

## 6. Mode pins

Connect the mode pins (MD0 to MD2) directly to V<sub>DD</sub> or V<sub>SS</sub>.

To prevent the device unintentionally entering test mode due to noise, lay out the printed circuit board so as to minimize the distance from the mode pins to V<sub>DD</sub> or V<sub>SS</sub> and to provide a low-impedance connection.

## 7. Turning the power supply on

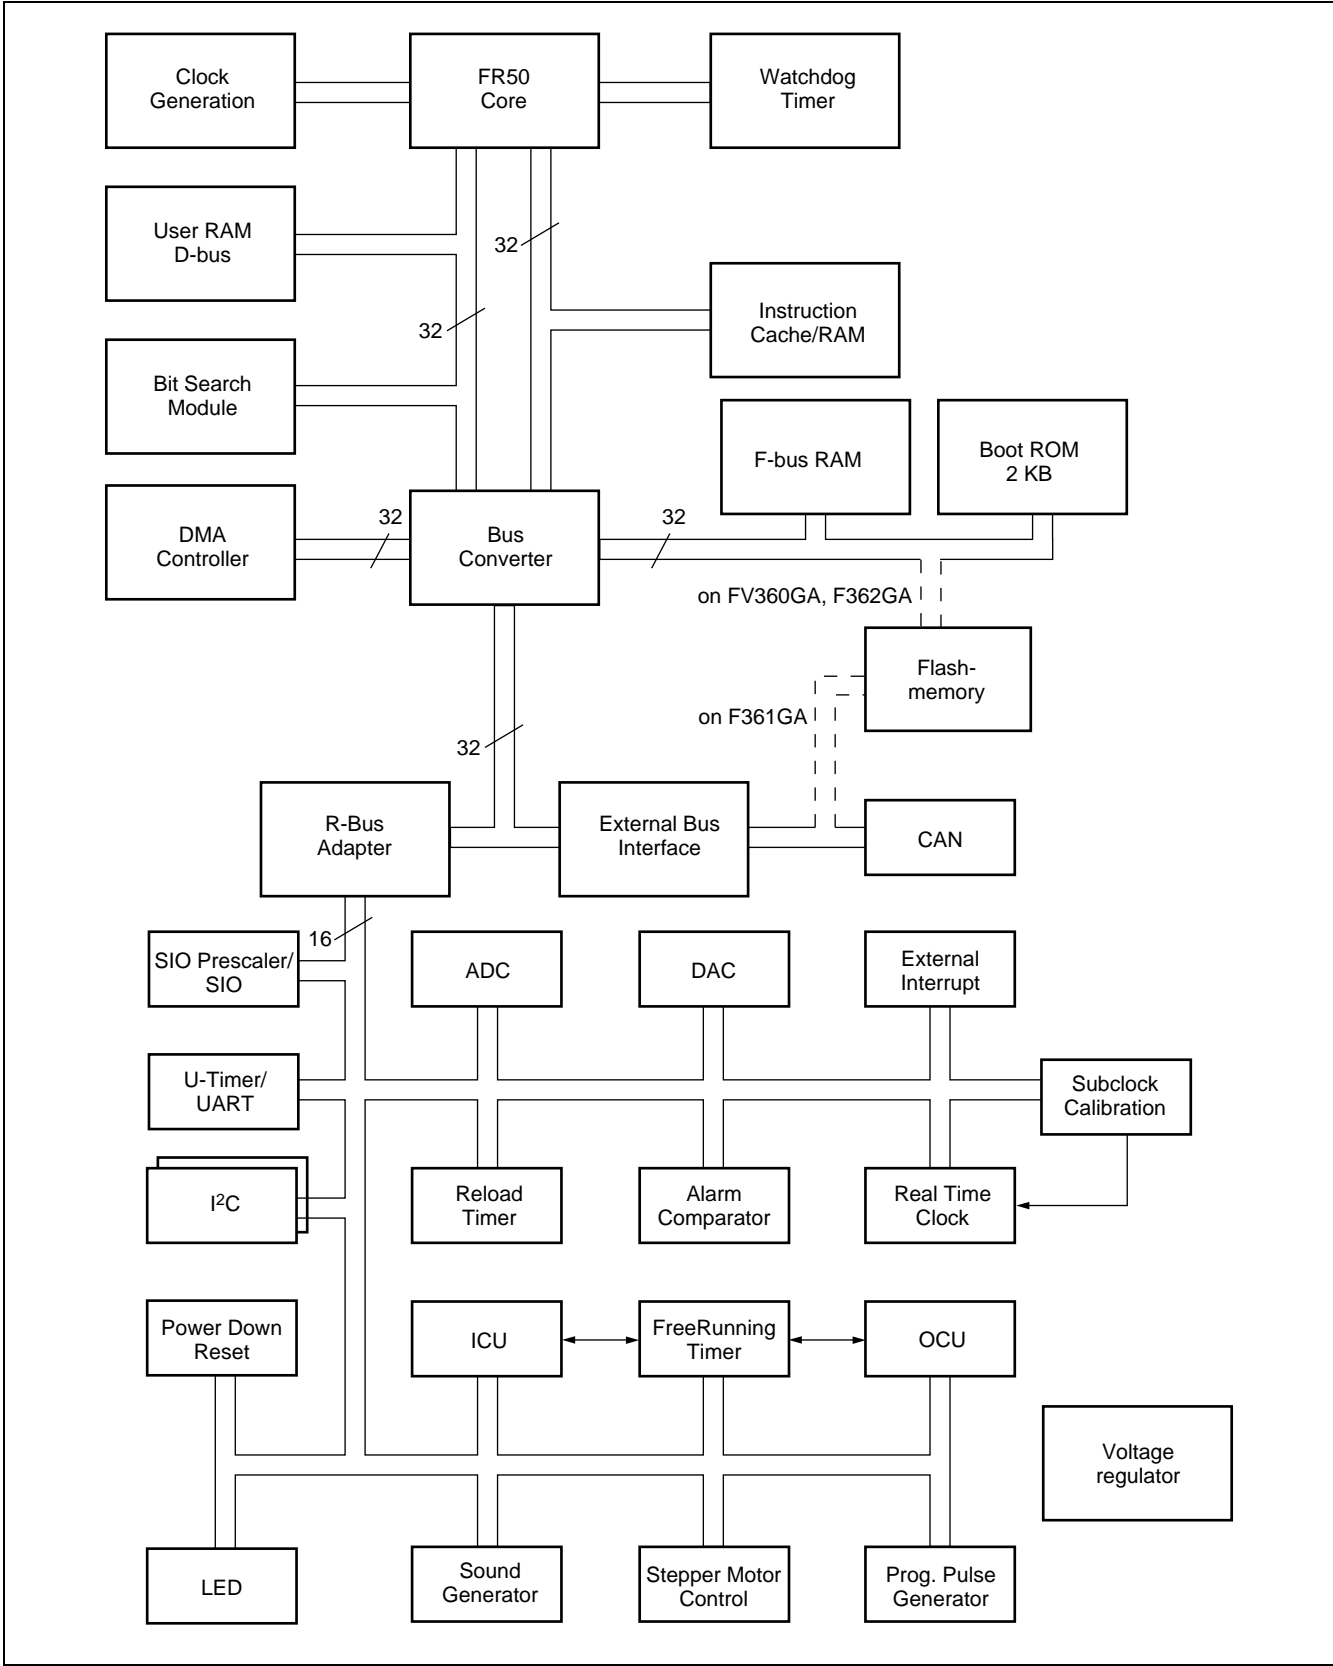

Immediately after power on always execute INIT at the  $\overline{\text{INIT}}$  pin (start with a low level at the  $\overline{\text{INIT}}$  pin) . Hold this low level at the  $\overline{\text{INIT}}$  pin long enough so that after release of the low level at  $\overline{\text{INIT}}$  and the passing of the built in waiting time stable oscillation of the oscillation circuit is achieved.  $\overline{\text{INIT}}$  must be pulled low for at least 8 cycles of the 4 MHz oscillation clock.

The analogue supply voltage (AV<sub>CC</sub>) must not be turned on before the digital supply voltage. If the external bus interface is supplied with 3.3 V this voltage also must not be turned on before the 5 V digital voltage has been switched on.

## 8. A state in turning power on

Output pin level is not guranteed while supply voltage does not reach minimum operation voltage in turning power on.

## 2. Dedicated Registers

Each of the dedicated registers is used for a particular purpose. The dedicated registers consist of the program counter (PC), program status (PS), table base register (TBR), return pointer (RP), system stack pointer (SSP), user stack pointer (USP), and multiplication and division result registers (MDH/MDL).

	32 bits	
Program counter	<div style="border: 1px solid black; width: 100px; height: 15px; margin: auto; display: flex; align-items: center; justify-content: center;">PC</div>	Initial value XXXX XXXXH (Indeterminate)

## (2) Condition Code Register (CCR)

## (3) System Condition Code Register (SCR)

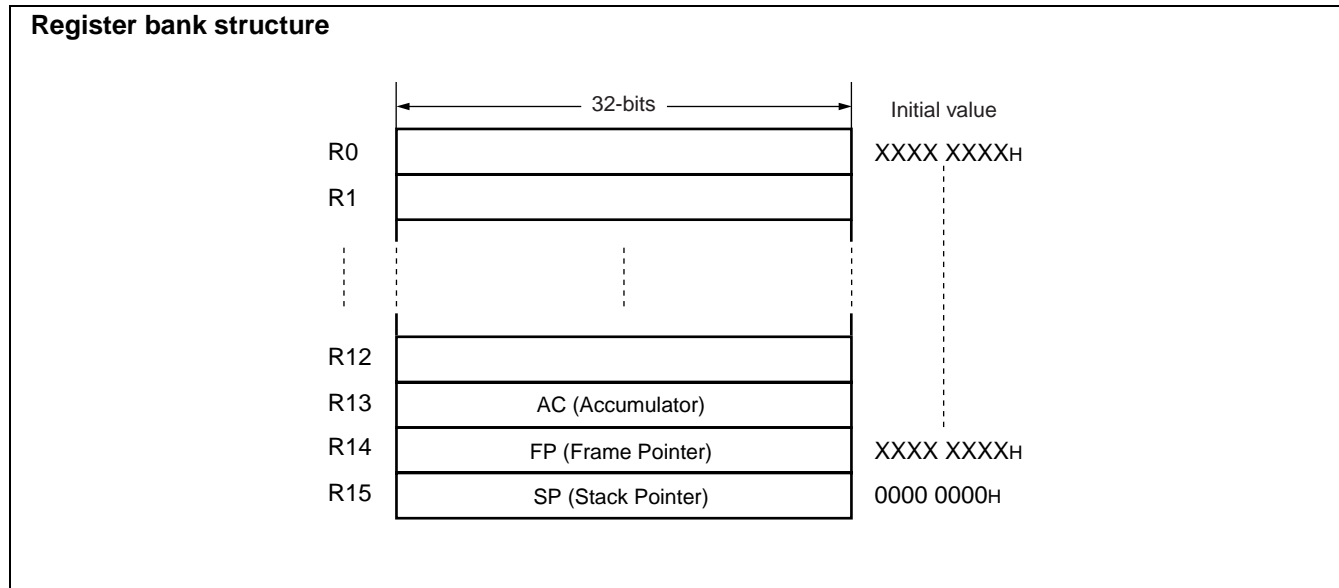

## (4) Interrupt Level Mask Register (ILM)

## 3. General-Purpose Registers

The general-purpose registers are CPU registers R0 to R15. The registers are used as the accumulator for operations and as pointers (a field indicating an address) for memory access. The user can specify the purpose for which the general-purpose registers are used.

Among 16 general-purpose registers, the following registers assume a special purpose. This enhances some instructions.

- R13 : Virtual accumulator (AC)
- R14 : Frame pointer (FP)
- R15 : Stack pointer (SP)

The initial value of R0 to R14 after a reset is indeterminate. The initial value of R15 is 00000000<sub>H</sub> (SSP value).

# MB91360G Series

## MODE SETTING

The FR50 series of devices uses mode pins (MD2 to MD0) and a mode register (MODR) to set the operation mode.

### (1) Mode Pins

Three mode pins (MD2 to MD0) are used to specify the reset mode vector access area.

Mode Pins			Mode name	Reset vector access area	Remarks
MD2	MD1	MD0			
0	0	0	Internal ROM mode vector	Internal	
0	0	1	External ROM mode vector	External	The mode register is used to set the bus width.
remaining settings			—	—	Reserved

### (2) Mode Register (MODR)

The data to be written to 0000\_7FDH using mode vector fetch is called mode data.

MODR is located at 0000\_07FDH. After an operation mode has been set in MODR, the device operates in this operation mode. MODR is set only when a reset factor (INIT level) occurs. User programs cannot write data to MODR.

< Mode Register (MODR) >

[Bits 7 to 3] : (Reserved bits)

Always set 00000 at bits 7 to 3. Operation is not guaranteed when other values are set.

[Bit 2] : ROMA (internal ROM enable bit)

The ROMA bit is used to set whether to validate the internal ROM area (Fbus memory area) .

ROMA	Function	Remarks
0	External ROM mode	Access to the Fbus area is external.
1	Internal ROM mode	

[Bits 1 and 0] : WTH1 and WTH0 (bus width/single chip mode specifying bits)

The WTH1 and WTH0 bits are used to set the bus width (valid when operation mode is external bus mode) and the single chip mode. When the operation mode is the external bus mode, this value is set at the BW1 and BW0 bits of AMD0 (CS0 area) .

WTH1	WTH0	Function	Remarks
0	0	8-bit bus width	External bus mode
0	1	16-bit bus width	External bus mode
1	0	32-bit bus width	External bus mode
1	1	Single chip mode	

### (3) Fixed Vector

If MB91360 series devices are started in mode MD[2 : 0] = 000, the internal fixed mode vector (FMV = 0x06) and the fixed reset vector are used. The fixed reset vector points to the start address of the internal Boot ROM.

This enables access to the F-bus area, to the internal CAN modules and the internal flash memory.

See also section Boot ROM.

\*1 : The ICRs are located in the interrupt controller and set the interrupt level for each interrupt request. An ICR is provided for each interrupt request.

\*2 : The vector address for each EIT (exception, interrupt or trap) is calculated by adding the listed offset to the table base register value (TBR) . The TBR specifies the top of the EIT vector table. The addresses listed in the table are for the default TBR value (0x000FFC00) . The TBR is initialized to this value by a reset.After execution of the internal boot ROM TBR is set to 0x00FFC00.

\*3 : Used by REALOS

\*4 : System reserved

\*5 : Only available on MB91FV360GA

\*6 : DMA to/from SIO is not yet implemented.

**■ PERIPHERAL RESOURCES**

**1. INSTRUCTION CACHE**

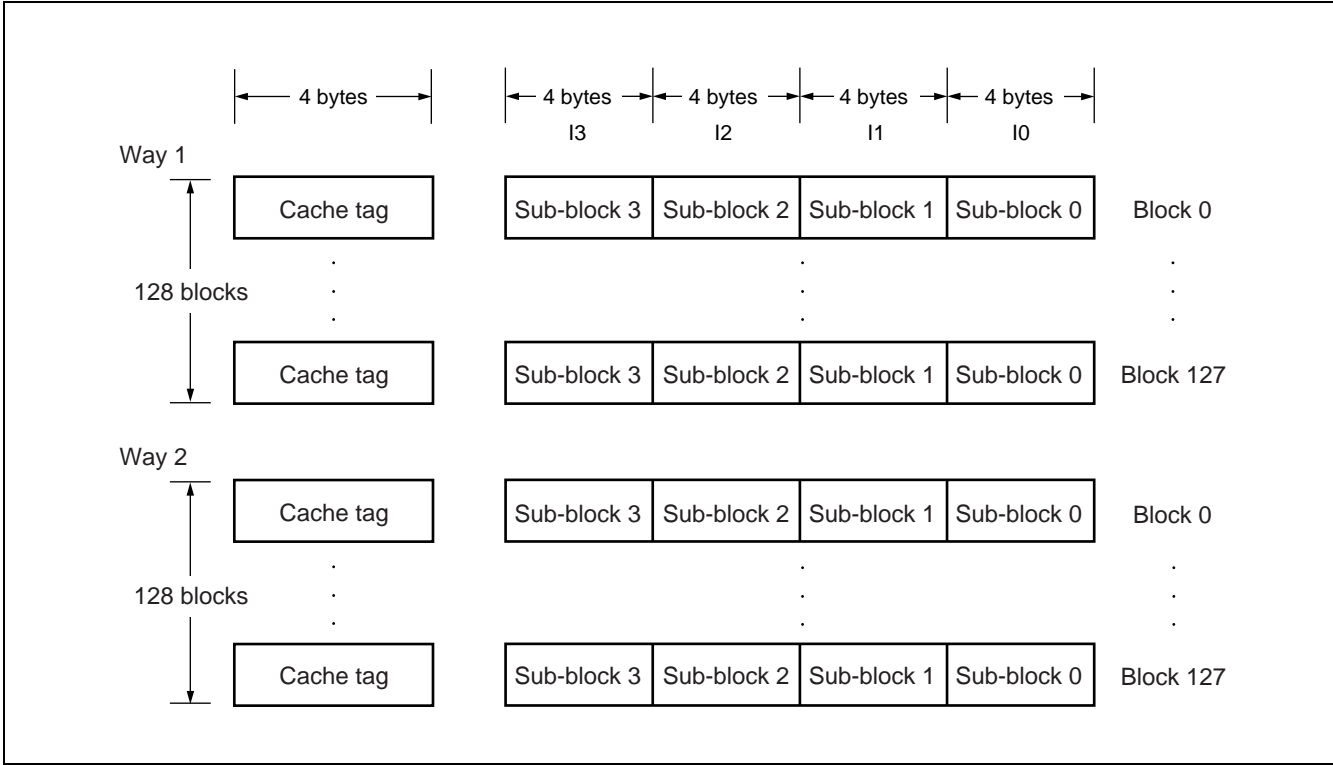

This section describes the instruction cache memory included in FR50 Family members and its operation. This only applies to MB91FV360GA and MB91F361GA.

**(1) General Description**

The instruction cache is temporary memory. When an external low-speed memory accesses an instruction code, the instruction cache stores the single-accessed code to increase the second and subsequent access speeds. Setting this memory to the RAM mode enables software to directly read and write instruction cache data RAM and tag RAM.

**(2) Main Body Structure**

- FR basic instruction length : 2 bytes
- Block arrangement system : 2-way set associative system
- Block
  - One way consists of 128 blocks.
  - One block consists of 16 bytes (= 4 sub-blocks) .
  - One sub-block consists of 4 bytes (= 1 bus access unit) .

**Instruction Cache Structure**

## 2. BOOT ROM

The Boot ROM is a fixed start-up routine which is located at FF000 (Reset entry) and will therefore be executed after every RST or INIT. The purpose of this ROM is to configure the device after a reset and to provide a simple serial bootloader for programming the embedded Flash memories.

The Boot ROM contains three logical parts :

### (1) Chip Initializations

Immediately after each reset, the following settings will be made :

CS0 : 200000...2FFFFFF, 32 Bit Bus, 1 wait-state (default external access)

CS1 : 180000...1FFFFFF, 32 Bit Bus, 1 wait-state (Flash Area only on F361GA)

CS7 : 100000...10FFFF, 16 Bit Bus, 1 wait-state (CAN)

In addition, the Table-Base Register will be initialized to 1FFC00 (F361GA only) and the synchronous reset (see TBCR) will be enabled.

### (2) Check for Bootcondition

After the chip initialization, the "Security-Vector" will be checked (Vector #66) . The purpose of this feature is to disable the bootstrapper due to security reasons.

The RSRR (reset cause register) will be read and saved. If no power-on reset (external  $\overline{\text{INIT}}$  input, RSRR = 0x80) is indicated, a branch to the user application will be initiated (Branch to 1F4000) .

If  $\overline{\text{INIT}}$  was detected and the "Security-Vector" check okay, the following conditions must be met in order to start the Bootstrapper :

Within a certain time, the start-up character "V" must be received via UART0 (9600, 8N1) . The time-out is set to 200 ms.

### (3) Bootstrapper

If the Bootcondition was met, an acknowledge character "F" will be transmitted via UART0 to indicate that the Bootloader is ready to accept commands. 4 different commands are possible :

- Receive and write to a specified memory block
- Dump the contents of a specified memory block
- Initiate a "CALL" to a certain location
- Re-dump a calculated checksum for verification

### (4) Configuration Register (Mode Register F362MD)

This register is used to control which pins of the external bus interface are active, where the pins for the external DMA channel are located and which I<sup>2</sup>C module is used.

address	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8
000001FE <sub>H</sub>	—	ASYMCLKT	HIZ_D_A	HIZ_ECLK	HIZ_D_23_16	HIZ_D_15_0	DMASWP	IICSEL
access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value		0	0	0	0	0	0	0

### 3. CLOCK MODULATOR

An important property of MCUs and other electronic devices is their electromagnetic compatibility - EMC. Besides a low susceptibility against external interferences, a low radiated emission is desired to avoid interference of adjacent devices.

Particularly the system clock and derived signals such as data- and address busses contribute significantly to the radiated emission. The purpose of the clock modulator is to spread the energy of these signals over a wide range of frequencies and thus reducing the amplitudes of the fundamental and harmonic frequencies.

With the use of an advanced frequency modulation algorithm, the Fujitsu built in clock modulator can achieve an attenuation of up to 20-25 dB compared to non modulated clock operation. Since the modulator is highly configurable, it can be optimally adjusted to the actual application in order to achieve minimal electromagnetic interference.

By default, the modulator is disabled and the MCU is running with unmodulated clock.

If you plan to use this feature, please contact Fujitsu.

## 4. I/O PORTS

There are 3 types of I/O port register structure; port data register (PDR7 to PDR5) , data direction register (DDR7 to DDR5) , and portfunction registers (PFR7 to PRF5) , where bits PDR7 to PDR5, bits DDR7 to DDR5, and bits PFR7 to PRF5 correspond respectively. Each bit on the register corresponds to an external pin. The PFR settings define whether a pin is used as a functional I/O (e.g. UART output) or as general purpose pin.

- For input (DDR = “0”) setting;  
PDR reading operation : reads level of corresponding external pin.  
PDR writing operation : writes set value to PDR.
- For output (DDR = “1”) setting;  
PDR reading operation : reads PDR value.  
PDR writing operation : outputs PDR value to corresponding external pin.

**(1) Register configuration**

## 5. DMA CONTROLLER (DMAC)

The DMAC module is used to implement direct memory access (DMA) transfer in FR50 series devices.

In a DMA transfer controlled by this module, various types of data can be transferred at high speed without involving the CPU, thus increasing system performance.

### (1) Hardware Configuration

The following are the main components of the DMAC module :

- Five independent DMA channels
- 5-channel independent access control circuit
- 32-bit address registers (Reload can be specified : Two registers for each channel.)
- 16-bit transfer count registers (Reload can be specified : One register for each channel.)
- 4-bit block count registers (One register for each channel)
- External transfer request input pins DREQ0, DREQ1, and DREQ2 (only channels 0, 1, and 2)
- External transfer request acceptance output pins DACK0, DACK1, and DACK2 (only channels 0, 1, and 2)
- DMA termination output pins DEOP0, DEOP1, and DEOP2 (only channels 0, 1, and 2)
- Two-cycle transfer

### (2) Main Functions

The following are the main functions of data transfer performed by the module :

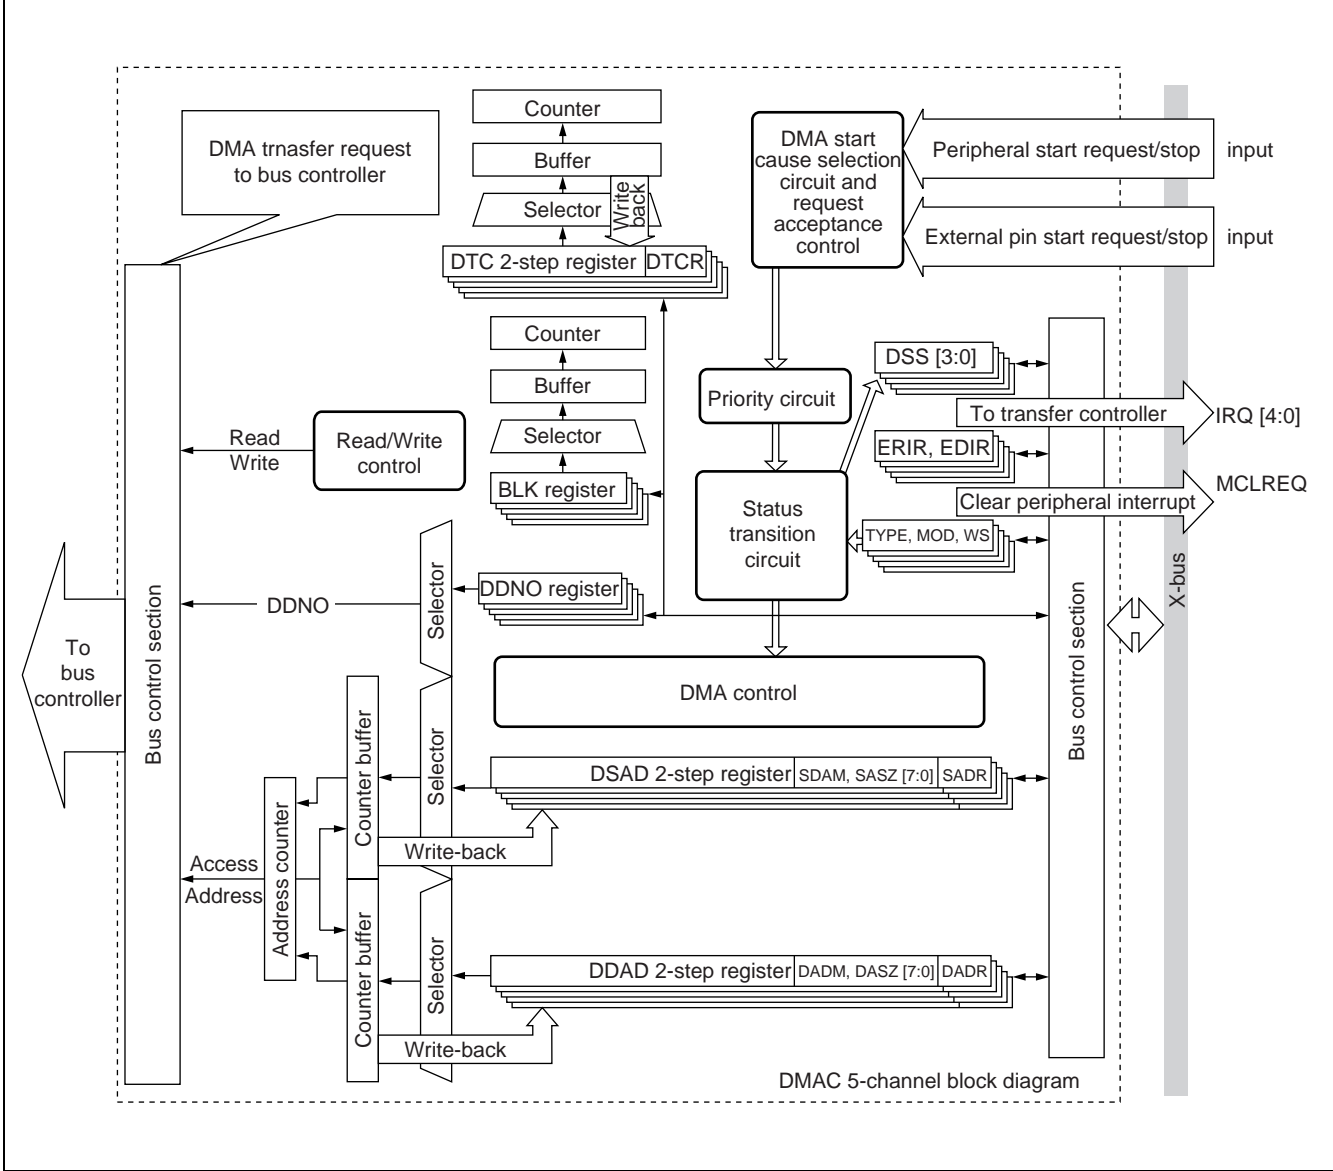

- Independent data transfer in multiple channels is enabled (5 channels) .
  - a : Priority (channel 0 > channel 1 > channel 2 > channel 3 > channel 4)
  - b : Priority can be alternated between channel 0 and channel 1.
  - c : DMAC start cause
    - External-only pin input (edge detection/level detection channels 0 to 2 only)
    - Internal peripheral request (interrupt request is shared, including external interrupts)
    - Software request (register write)
  - d : Transfer mode
    - Demand transfer, burst transfer, step transfer, block transfer
    - Addressing mode 32-bit full address specification (increase, decrease, fixed)  
(An address increment/decrement size of -255 to +255 can be specified.)
    - Data types of byte, halfword, and word lengths
    - Single-shot/reload selectable

## 6. UART

The UART is a serial I/O port for performing asynchronous (stop-start synchronization) communications. The MB91360G series contains three UART channels.

### (1) Features

- Full-duplex, double buffering
- Supports asynchronous (stop-start synchronization) communications
- Supports multi-processor mode
- Fully programmable baud rate  
The baud rate can be set using an internal timer. (See the U-TIMER section.)
- Supports flexible baud rate setting using an external clock
- Error detection function (parity, framing, overrun)
- Non return to zero (NRZ) transfer signal
- Supports DMA transfer activation using an interrupt

## (2) Register Configuration

## 7. U-TIMER (16-bit Timer for UART Baud Rate Generation)

The U-timer (U-TIMER) is a 16-bit timer used to generate the baud rate for the UART. The operating frequency of the chip and the U-TIMER reload value can be combined to set a user-defined baud rate.

The MB91360G series contains three U-TIMER channels. The intervaltimers can count for a maximum of  $216 \times \phi$ .

## 8. PWM TIMER

The PWM (Pulse Width Modulation) timer can output high-precision pulse waves at an arbitrary cycle and pulse width (duty ratio) .

The MB91360G series contains eight PWM timer channels. Each of the channels consists of a 16-bit down-counter, cycle setting register, duty setting register, and pin controller.

The control status register for each channel is used to indicate the operation status of the PWM timer. General control registers 1 and 2 are common registers shared by four channels, serving for input and software triggering.

### (1) Features

- The count clock for the 16-bit down-counter can be selected from among the following four types :  
Internal clocks :  $\phi$ ,  $\phi/4$ ,  $\phi/16$ ,  $\phi/64$  ( $\phi$  : Machine clock for peripherals)
- The counter can be initialized to "FFFFH" by a reset or underflow.  
The 16-bit down-counter causes an underflow when it changes from "0000H" to "FFFFH".
- Each channel has PWM outputs.
- Eight channels : Eight output pins
- Registers
- Cycle setting register : Data reload register with buffer
- Data transfer from the buffer is performed either when an activation trigger is detected or when the down-counter causes an underflow (cycle match) . The output is inverted at a cycle match.
- Duty setting register : Compare register with buffer.
- The value set in this register is compared to the counter value. The output is inverted when the values match (duty match) .
- Pin control
- A duty match causes a reset to "1" (given priority) .
- An underflow causes a reset to "0".
- The output value fix mode enables output of all "L" or all "H".
- The polarity can also be specified.
- Interrupt requests can be generated by selecting the following interrupt sources :
- Activation of the PWM timer (software trigger or trigger input)
- Occurrence of an underflow (cycle match)
- Occurrence of a duty match
- Occurrence of an underflow (cycle match) or duty match
- You can set simultaneous activation of two or more channels using software or another interval timer. You can also set restarting the PWM timer during operation.

## 9. 16-BIT RELOAD TIMER

Each 16-bit reload timer consists of a 16-bit down-counter, a 16-bit reload register, a prescaler for generating the internal count clock, and a control register.

The 16-bit reload timer can also activate DMA transfer using interrupts.

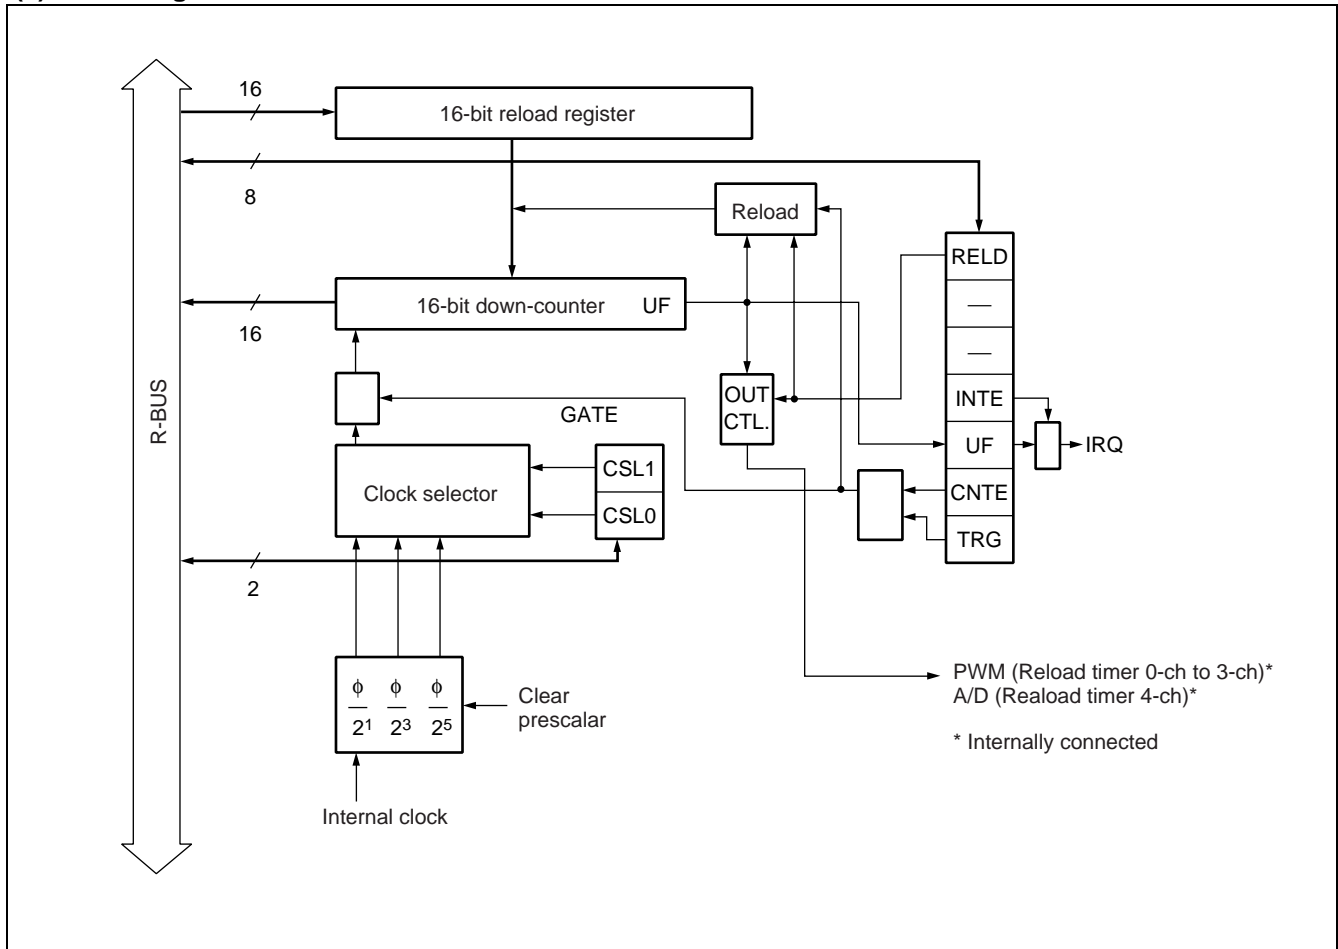

The MB91360G series contains six 16-bit reload timer channels.

## 10. BIT SEARCH MODULE

The bit search module searches for a “0”, “1”, or change-point in the data written to the input register and returns the position of the detected bit.

This section describes the data register for detecting zeros (BSD0) , data register for detecting ones (BSD1) , data register for detecting change-points (BSDC) , and detection result register (BSRR) .

### a : Data register for detecting zeros (BSD0)

Address	31	Register structure	0	Initial value	Access
0000 03F0H				Indeterminate	W

### b : Date register for detecting ones (BSD1)

Address	31	Register structure	0	Initial value	Access

## 11. 10-BIT A/D CONVERTER (Successive Approximation Conversion Type)

This section provides an overview of the A/D converter, describes the register structure and functions, and describes the operation of the A/D converter.

A/D Converter converts analog input voltage into digital values, and provides the following features.

- Conversion time : minimum 178 cycles (32 MHz : 5.6  $\mu$ s, 24 MHz : 7.4  $\mu$ s, 16 MHz : 11.2  $\mu$ s) per channel
- RC type successive approximation conversion with sample & hold circuit
- 10-bit resolution
- Program selection analog input from 16 channels
- Single conversion mode : conversion of one selected channel
- Scan conversion mode : continuous conversion of multiple channels, programmable for up to 16 channels
- Single conversion mode : Convert the specified channel once only.
- Continuous mode : Repeatedly convert the specified channels.
- Stop mode : Convert one channel then temporarily halt until the next activation.

(Enables synchronization of the conversion start timing.)

A/D conversion can be followed by an A/D conversion interrupt request to CPU. This interrupt, an option that is ideal for continuous processing can be used to start a DMA transfer of the results of A/D conversion to memory.

- Startup may be by software, external trigger (falling edge) or timer (rising edge)

## 12. INTERRUPT CONTROLLER

An interrupt controller controls interrupt acceptance and arbitration processing.

Hardware configuration

This module consists of the following :

- ICR register
- Interrupt priority evaluation circuit
- Interrupt level and interrupt number (vector) generator
- Hold request cancel request generator

Major functions

This module has the following major functions :

- Detecting an NMI request or interrupt request
- Priority evaluation (using the level or number)
- Transferring the level of the interrupt cause in the evaluation result (to the CPU)
- Transferring the number of the interrupt cause in the evaluation result (to the CPU)
- Instructing recovery from stop mode due to an NMI or interrupt level other than 11111 (to the CPU)
- Generating a hold request cancel request for the bus master

## 13. EXTERNAL INTERRUPT/NMI CONTROL BLOCK

The external interrupt/NMI controller controls external interrupt requests input from the NMI and INT0 to INT7 pins.

Detection of “H” levels, “L” levels, rising edges, or falling edges can be selected (except for the NMI) .

The external interrupt/NMI controller can also be used for DMA requests.

This section lists the registers of the controller and provides its block diagram.

### (1) Register configuration of the External Interrupt NMI Controller

External interruption permission register (ENIR)

## 14. DELAYED INTERRUPT

### Delayed Interrupt Control Register (DICR)

The delayed interrupt control register (DICR) is a delayed interrupt generator register and is used to generate the task switching interrupt.

#### Structure of the DICR

# MB91360G Series

## 15. CLOCK GENERATION

The MB91V360 generates internal operating clocks as follows :

- Base clock generation : Device scales clock source input by 2 (X clock) or oscillates base clock with PLL to generate basic clock (PLL clock)
- Generation of each internal clock : Device scales base clock to generate clocks supplied to each block

Generation and control of each clock are explained below.

Some devices allow the operation of the RTC module based on a separate 32 kHz subclock. See the section about subclock operation for more details.

### (1) Register Configuration

## 16. BUS INTERFACE

The external bus interface controls the interfaces with the external memory and external I/Os.

- Up to 32-bit (4 GB) address output.
- Up to eight independent banks provided by chip-select function  
The banks can be set in 64-KB (minimum) at any position in the logic address space.  
Can be set to no area
- 32/16/8 bit bus width setup can be performed for each chip-select area.
- Programmable automatic memory wait (up to 7 cycles) insertion

Note : Chip Select Areas CS7 and CS1 are used for the internal CAN modules and Flash module (F361GA only) respectively. The necessary register settings are done by an internal boot routine. Take care not to overwrite register bits related to those CS areas.

If the CAN macros and the flash memory which are connected internally to the external bus (also called User Logic Bus) are used, a certain number of data, address and control ports of the external bus interface cannot be configured as general purpose IO ports.

### (1) Register Configuration

Area select Registers (ASR0 to ASR7)			
	bit 7	bit 0	R/W
00000640 <sub>H</sub>	ASR0	00000000 <sub>B</sub>	W
00000644 <sub>H</sub>	ASR1	0000XXXX <sub>B</sub>	W
00000648 <sub>H</sub>	ASR2	0000XXXX <sub>B</sub>	W
0000064C <sub>H</sub>	ASR3	0000XXXX <sub>B</sub>	W
0000650 <sub>H</sub>	ASR4	0000XXXX <sub>B</sub>	W

## 17. CAN CONTROLLER

This section provides an overview of the CAN Interface, describes the register structure and functions, and describes the operation of the CAN Interface.

The CAN controller is a module built into a MB91360G series. The CAN (Controller Area Network) is the standard protocol for serial communication between automobile controllers and is widely used in industrial applications.

The CAN controller has the following features :

- Conforms to CAN Specification Version 2.0 Part A and B
  - Supports transmission/reception in standard frame and extended frame formats
- Supports transmitting of data frames by receiving remote frames
- 16 transmitting/receiving message buffers
  - 29-bit ID and 8-byte data
  - Multi-level message buffer configuration
- Supports full-bit comparison, full-bit mask and partial bit mask filtering.
  - Two acceptance mask registers in either standard frame format or extended frame formats
- Bit rate programmable from 10 Kbits/s to 1 Mbits/s (when input clock is at 16 MHz)

The following sections only describe CAN 0. For the addresses of the registers of the other CAN channels see the IO-Map.

## 18. D/A CONVERTER

This section provides an overview of the D/A converter, describes the register structure and functions, and describes the operation of D/A converter. This block is an R-2R format D/A converter, having ten-bit resolution. The D/A converter has two channels. Output control can be performed independently for the two channels using the D/A control register.

## 19. 100 kHz I<sup>2</sup>C INTERFACE

This section describes the functions and operation of the MB91360G series basic I<sup>2</sup>C interface. This interface allows operation up to 100 kHz and 8-bit-addressing.

The I<sup>2</sup>C interface is a serial I/O port supporting the Inter IC bus, operating as a master/slave device on the I<sup>2</sup>C bus.

### (1) I<sup>2</sup>C Interface Features

The MB91360G series microcontroller includes a built-in one-channel I<sup>2</sup>C interface. The I<sup>2</sup>C interface has the following features.

- Master/slave sending and receiving functions
- Arbitration function
- Clock synchronization function
- Slave address/general call address detection function
- Transfer direction detection function
- Repeated start condition generation and detection function
- Bus error detection function

## (2) I<sup>2</sup>C Interface Registers

(3) I<sup>2</sup>C Interface Block Diagram

## 20. 400 kHz I<sup>2</sup>C INTERFACE

This section describes the functions and operation of the fast I<sup>2</sup>C interface.

The I<sup>2</sup>C interface is a serial I/O port supporting the Inter IC bus, operating as a master/slave device on the I<sup>2</sup>C bus.

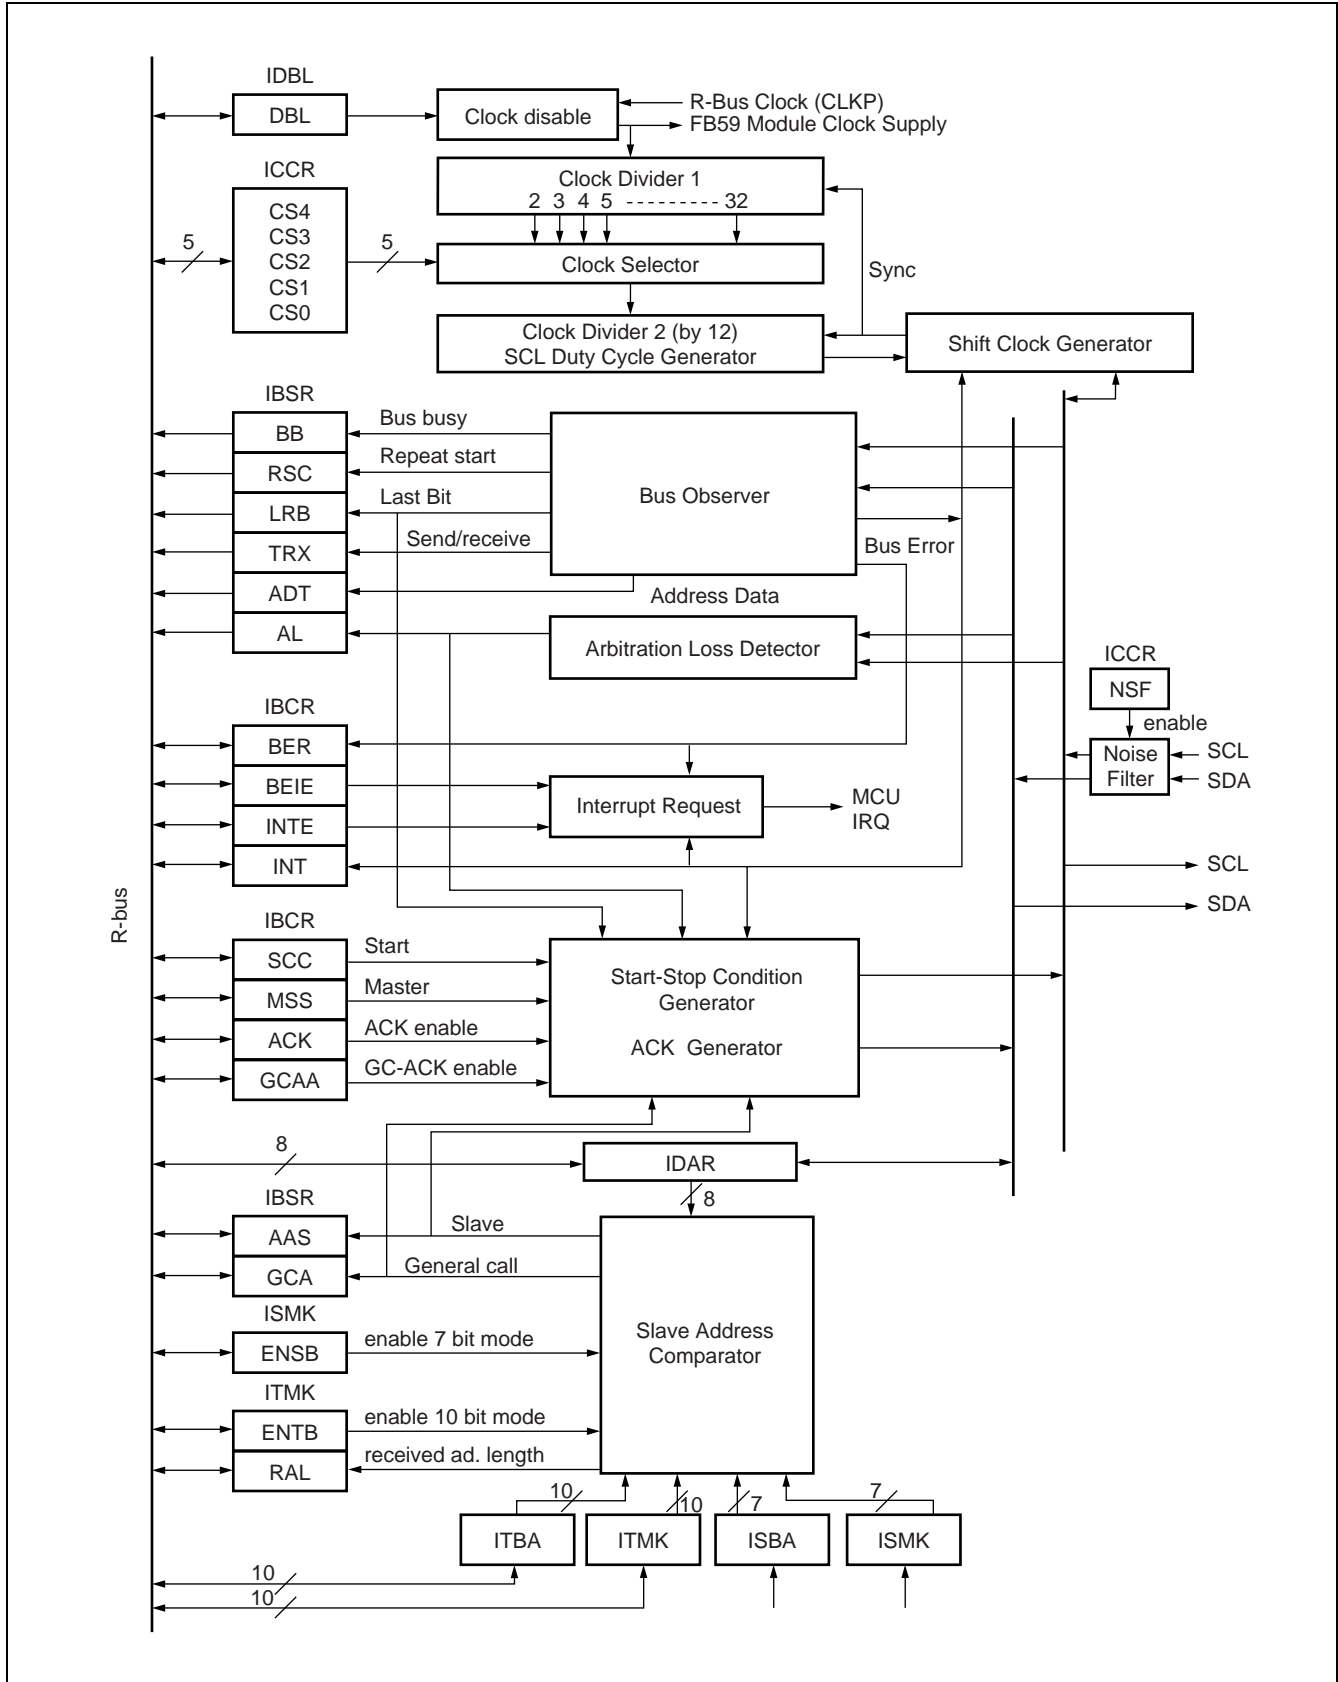

### (1) Features

- Master/slave transmitting and receiving functions
- Arbitration function
- Clock synchronization function
- General call addressing support
- Transfer direction detection function
- Repeated start condition generation and detection function
- Bus error detection function
- 7 bit addressing as master and slave
- 10 bit addressing as master and slave
- Possibility to give the interface a seven and a ten bit slave address
- Acknowledging upon slave address reception can be disabled (Master-only operation)
- Address masking to give interface several slave addresses (in 7 and 10 bit mode)
- Up to 400 KBit transfer rate
- Possibility to use built-in noise filters for SDA and SCL
- Can receive data at 400 KBit if R-Bus-Clock is higher than 6 MHz regardless of prescaler setting
- Can generate MCU interrupts on transmission and bus error events
- Supports being slowed down by a slave on bit and byte level

The I<sup>2</sup>C interface does not support SCL clock stretching on bit level since it can receive the full 400 KBit data rate if the R-Bus-Clock (CLKP) is higher than 6 MHz regardless of the prescaler setting. However, clock stretching on byte level is performed since SCL is pulled low during an interrupt (INT = "1" in IBCR register) .

## 21. 16-BIT I/O TIMER

The MB91360G Series contains two 16-bit free-running timer modules, two output compare modules, and two input capture modules and supports four input channels and four output channels. The following sections only describes the 16-bit free-running timer, Output Compare 0/1 and Input Capture 0/1.

The remaining modules have the identical functions and the register addresses should be found in the I/O map.

### (1) Function Overview

#### a : 16-bit free-running timer

The 16-bit free-run timer consists of a 16-bit up counter, control register, and prescaler. The values output from this timer counter are used as the base timer for input capture and output compare.

- Four counter clocks are available.  
Internal clock :  $\phi/4$ ,  $\phi/16$ ,  $\phi/32$ ,  $\phi/64$
- An interrupt can be generated upon a counter overflow or a match with compare register 0.
- The counter value can be initialized to "0000H" upon a reset, software clear, or match with compare register 0.

#### b : Output compare (2 channels per one module)

The output compare module consists of two 16-bit compare registers, compare output latch, and control register.

When the 16-bit free-running timer value matches the compare register value, the output level is reversed and an interrupt is issued.

- The two compare registers can be used independently.  
Output pins and interrupt flags corresponding to compare registers
- Output pins can be controlled based on pairs of the two compare registers.  
Output pins can be reversed by using the two compare registers.
- Initial values for output pins can be set.
- Interrupts can be generated upon a compare match.

#### c : Input capture (2 channels per one module)

The input capture module consists of two 16-bit capture registers and control registers corresponding to two independent external input pins. The 16-bit free-running timer value can be stored in the capture register and an interrupt is issued simultaneously upon detection of an edge of a signal input from an external input pin.

- The detection edge of an external input signal can be specified.  
Rising, falling, or both edges
- Two input channels can operate independently.
- An interrupt can be issued upon a valid edge of an external input signal.

## 23. POWER DOWN RESET

This section provides an overview of the Power Down Reset, describes the register structure and functions, and describes the operation of the Power Down Reset Module.

The power down reset module performs a system reset when  $V_{CC}$  goes below a threshold voltage. The reset signal is disabled and enabled by setting the power down reset control register PDRCR. For low power applications the digital and the analog part of the power down reset control circuit can be disabled.

## 24. SERIAL I/O INTERFACE (SIO)

This section provides an overview of the Serial I/O Interface (SIO), describes the register structure and functions, and describes the operation of the SIO.

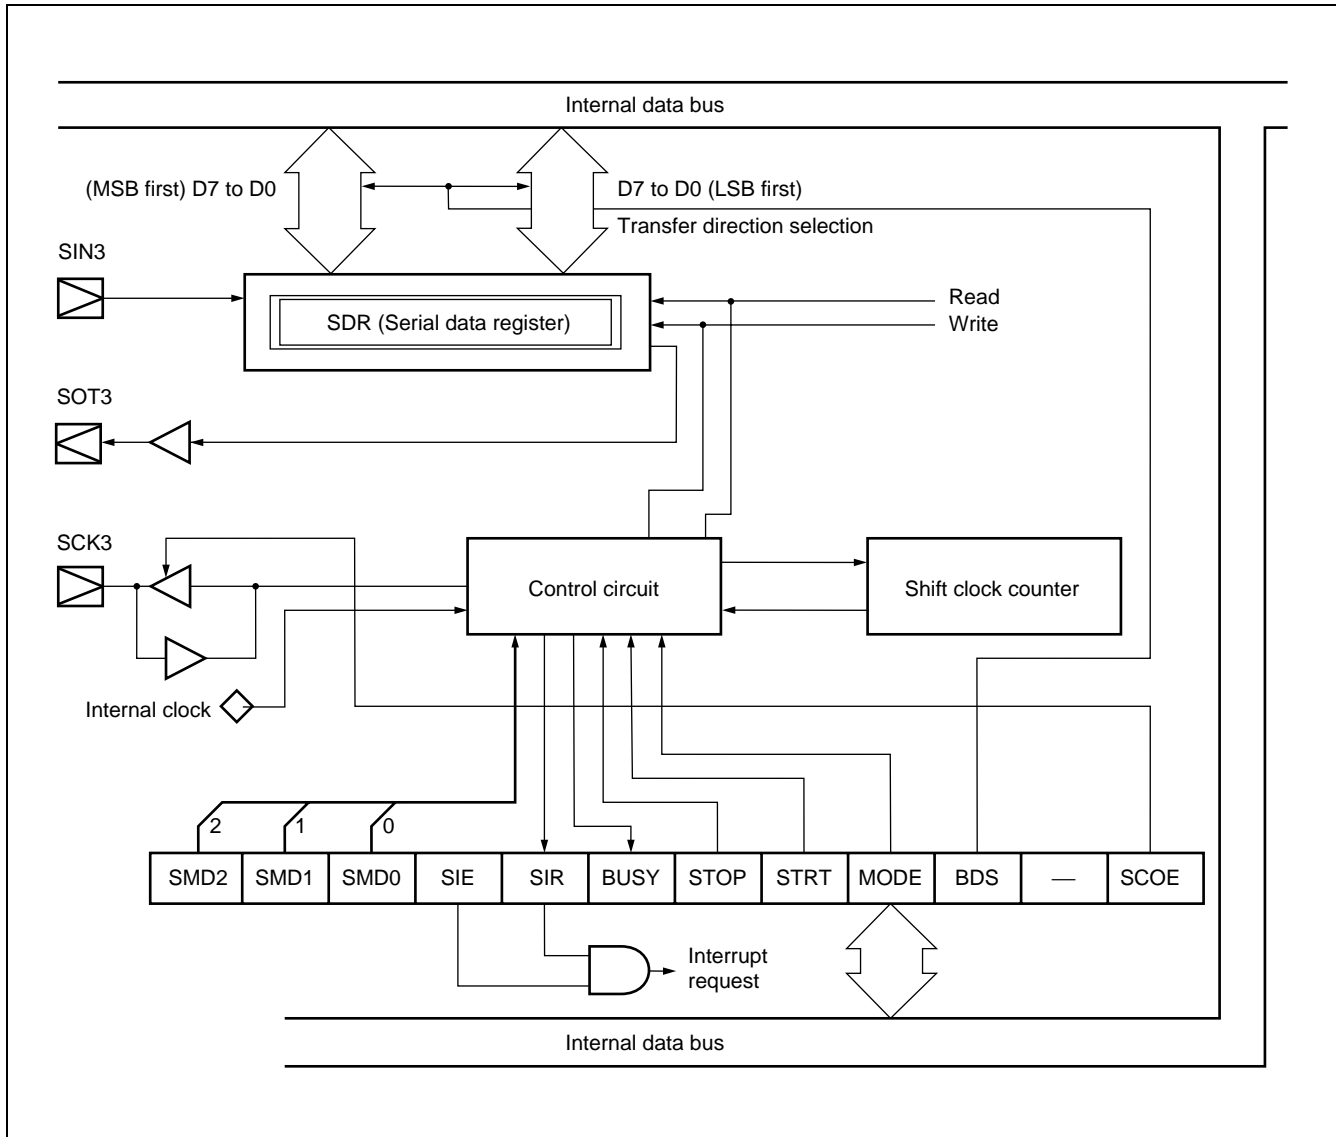

### (1) Block Diagram

This block is a serial I/O interface that allows data transfer using clock synchronization. The interface consists of a single eight-bit channel. Data can be transferred from the LSB or MSB.

MB91360G series contains two Serial I/O units SIO0 and SIO1. This section only describes SIO0. Please see the IO-Map for the register addresses of SIO1.

The serial I/O interface operates in two modes :

- Internal shift clock mode : Data is transferred in synchronization with the internal clock.
- External shift clock mode : Data is transferred in synchronization with the clock supplied via the external pin (SCK). By manipulating the general-purpose port sharing the external pin (SCK), data can also be transferred by a CPU instruction in this mode.

## 26. STEPPER MOTOR CONTROLLER

This section provides an overview of the Stepper Motor Control Module, describe the register structure and functions, and described the operation of the Stepper Motor Control Module.

The Stepping Motor Controller consists of two PWM Pulse Generators, four motor drivers, Selector Logic and the Zero Rotor Position Detector. The four motor drivers have high output drive capabilities and they can be directly connected to the four ends of two motor coils. The combination of the PWM Pulse Generators and Selector Logic is designed to control the rotation of the motor. A Synchronization mechanism assures the synchronous operations of the two PWMs. The Zero Rotor Position Detector helps CPU obtain feed back information of the rotor movements. The following sections describe the Stepping Motor Controller 0 only. The other controllers have the same functions. The register addresses are found in the I/O map.

Note : The Rotor Zero Position Detection capability is protected by a patent from Mannesmann VDO and may only be used with VDO's prior approval.

# MB91360G Series

## 28. SUBCLOCK

The Subclock System provides various power saving modes. The key of the concept is to supply the 32 kHz clock signal only to the Real Time Clock (RTC) Module, while the rest of the MCU is provided with 4 MHz clock signal in order to achieve lower power supply current in the RTC32K mode.

This behavior can be altered by the configuration input, SELCLK pin to switch the RTC module to operate with the 4 MHz clock. The following sections describe the operation with SELCLK connected to "0" and SELCLK connected to "1" respectively.

Note : On MB91F361GA and MB91F362GA SELCLK should always be connected to "1", subclock operation is not implemented on those devices.

### (1) Operation of Subclock (SELCLK = 0)

The next table summarizes the operation states of the components related to the Subclock System. To simplify this table SLEEP modes are not listed but the operation is the same as for RUN modes except that the CPU is stopped.

Mode	Power dissipation	Operation of components				
		4 M Osc.	32 K Osc.	RTC	CPU & Peripheral	PLL
RUN	High	Run	Run	Run	Run	Stop/Run
RTC4M32K	Medium Low	Run	Run	Run	Stop	Stop
RTC32K	Low	Stop	Run	Run	Stop	Stop
STOP	Lowest	Stop	Stop	Stop	Stop	Stop

The following table summarizes those operation modes and necessary software settings.

Mode	Software Setting					
	STOP	PLL1EN	PLL2EN	OSCD1	OSCD2	RTC32
RUN	0	0 or 1	1	Don't Care	Don't Care	Don't Care
RTC4M32K	1	Don't Care	1	0	0	Don't Care
RTC32K	1	Don't Care	1	1	0	1
STOP	1	Don't Care	Don't Care	1	1	Don't Care

It is recommended that PLL2EN is set to "1" after the initialization to start the 32 kHz oscillation and this bit should be kept at "1" during the operation. Otherwise the 32 kHz oscillator does not start. Also bits 9 and 10 of the CLKR register (address 0046H) should always be set to "0" during operation.

## (2) 4 MHz Real Time Clock Configuration (SELCLK = 1)

When the SELCLK pad is connected logic level 1, the 32 kHz oscillation is disabled regardless of the software setting. In this configuration, the Real Time Clock Module is supplied with the 4 MHz oscillation clock signal.

The following table summaries the modes available in this configuration.

Mode	Power dissipation	Operation of components				
		4 M Osc.	32 K Osc.	RTC	CPU & Peripheral	PLL
RUN	High	Run	Stop	Run	Run	Stop/Run
RTC4M	Medium Low	Run	Stop	Run	Stop	Stop
STOP	Lowest	Stop	Stop	Stop	Stop	Stop

Mode	Software Setting					
	STOP	PLL1EN	PLL2EN	OSCD1	OSCD2	RTC32
RUN	0	0 or 1	Don't Care	Don't Care	Don't Care	Don't Care
RTC4M	1	Don't Care	Don't Care	0	Don't Care	Don't Care
STOP	1	Don't Care	Don't Care	1	Don't Care	Don't Care

## (3) Use of Real Time Clock Module

There is some additional consideration needed to operate the RTC module to achieve the desired functionality.

Because the RTC module is directly connected to the 32 kHz oscillation clock, the oscillation stabilization time has to be taken care of by the software. This can be achieved by using another timer (e.g the Time Base Timer) to trigger the software to start the RTC module (Setting of ST bit to "1").

It is also important to stop the RTC module before entering the STOP mode. Otherwise, the reactivation from STOP mode results in unpredictable operation of the RTC module.

After the reactivation, the oscillation stabilization time has to be measured again by the software, then the RTC module can be restarted.

# MB91360G Series

## 29. 32 kHz CLOCK CALIBRATION UNIT

The 32 kHz Clock Calibration Module provides possibilities to calibrate the 32 kHz oscillation clock with respect to the 4 MHz oscillation clock.

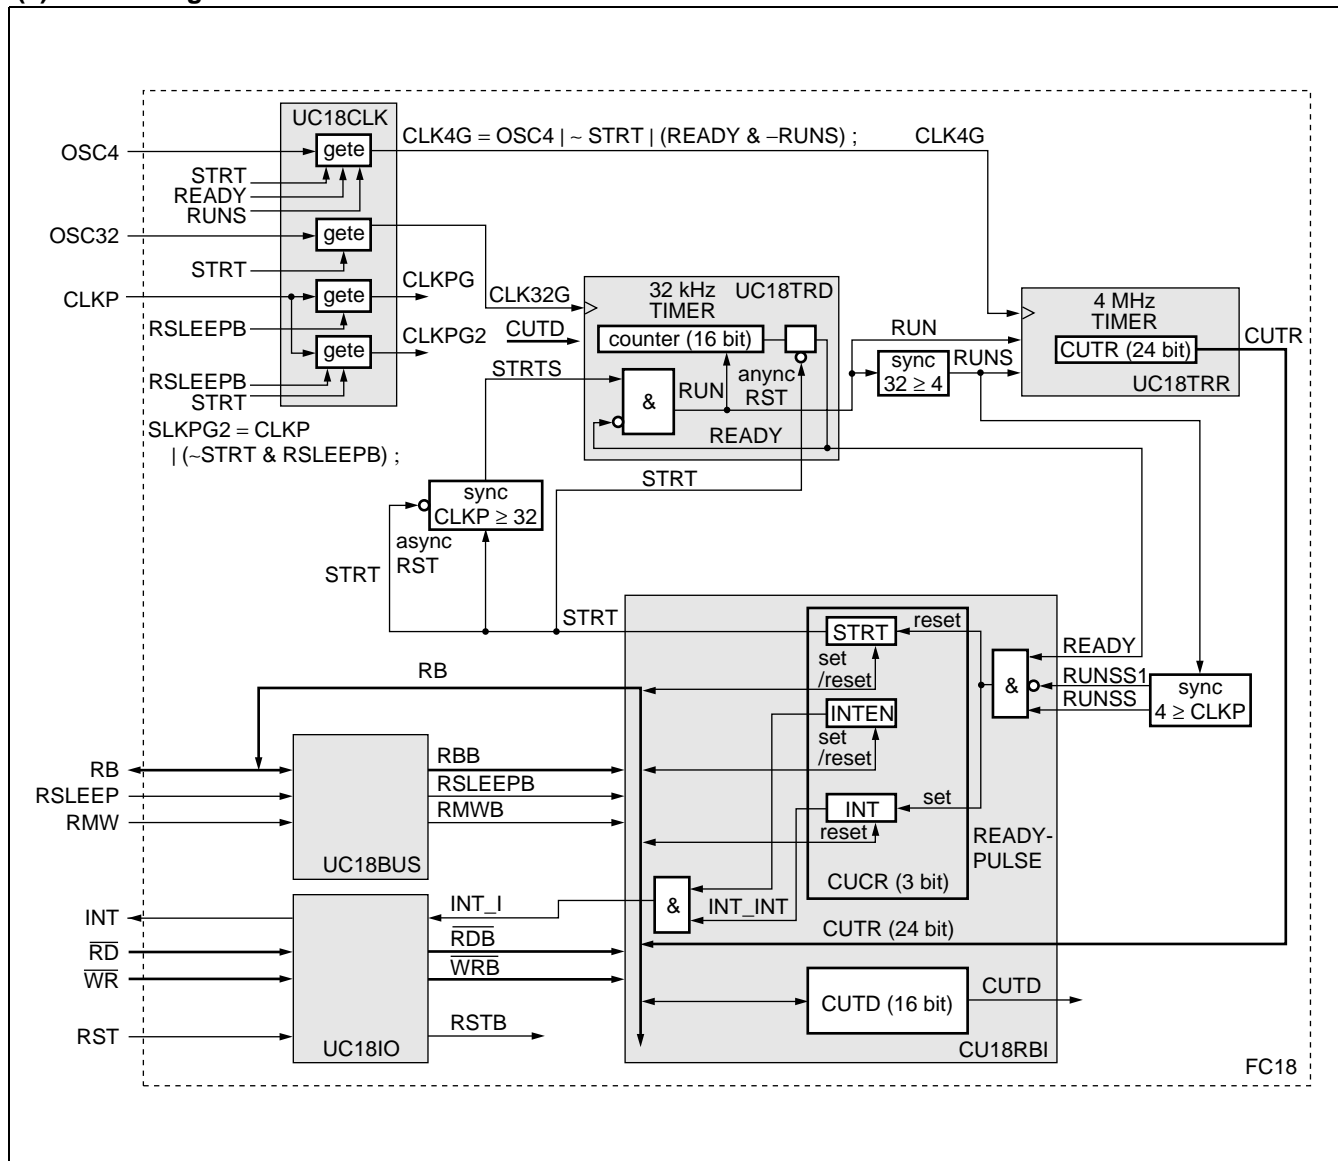

### (1) Description

This hardware allows the software to measure time generated by the 32 kHz clock with the 4 MHz clock.

By utilizing this hardware in conjunction with software processing, the accuracy of the 32 kHz clock can come closer to that of the 4 MHz clock. The measurement result from the 32 kHz Clock Calibration Module can be processed by the software and the setting required for the Real Time Clock Module can be obtained.

This module consists of two timers, one operating with the 32 kHz clock and the other operating with the 4 MHz clock. The 32 kHz timer triggers the 4 MHz timer and resulting 4 MHz timer value is stored in a register. The value stored in this register can be used for the subsequent software processing to calculate the desired Real Time Clock module's setting.

### (2) Block Diagram

(3) Timing

# MB91360G Series

## (4) Clocks

The module operates with 3 different clocks : The 4 MHz clock OSC4, the 32 kHz clock OSC32 and the Rbus clock CLKP. Synchronization circuits adapt the different domains.

All 3 clocks are gated. The 32 kHz and the 4 MHz clock are switched off if STRT is 0. CLKPG is gated by RSLEEP and CLKPG2 by RSLEEP and STRT for the 2 bits, which are set/reset by hardware.

The clock frequencies have to fulfill the following requirements :

### 1.) Clock ratio

$$T_{OSC32} > 2 \times T_{OSC4} + 3 \times T_{CLKP}$$

$$T_{OSC4} < 1 / 2 \times T_{OSC32} - 3 / 2 \times T_{CLKP}$$

$$T_{CLKP} < 1 / 3 \times T_{OSC32} - 2 / 3 \times T_{OSC4}$$

2.) The input frequencies must not exceed the values given in next table.

### Maximum operation frequencies

	CLKP		OSC32		OSC4	
maximum	32 MHz	31.25 ns	4 MHz	250 ns	13 MHz	76.9 ns

### Examples of valid clock ratios which fulfill requirements 1 and 2

	OSC32		OSC4		CLKP	
maximum operation speed	4 MHz	250 ns	13 MHz	76.9 ns	32 MHz	31.25 ns
standard TDIR mode	500 kHz	2000 ns	4 MHz	250 ns	4 MHz	250 ns
normal operation	32 kHz	31.25 us	4 MHz	250 ns	> 2 MHz	500 ns

## 30. FLASH MEMORY

MB91360G series devices feature 512 K of embedded flash memory. On MB91F361GA it is connected to the external bus, on the other devices to the F-bus.

### (1) Out Line of Flash Memory

The Flash Memory consists of a flash memory unit derived from the MBM29LV400C and a flash memory interface circuit.

Flash Memory :

- 512 Kword  $\times$  8 bit/256 Kword  $\times$  16 bit/128 Kword  $\times$  32 bit  
(64 Kbyte $\times$ 3 + 32 Kbyte + 8 Kbyte $\times$ 2 + 16 Kbyte) sectors
- Uses automatic program algorithm (Embedded Algorithm™)
- Erase pause/restart function
- Detects completion of writing/erasing using data polling or toggle bit functions
- Detects completion of writing/erasing by RY/BY pin
- Compatible with JEDEC standard commands
- Performs minimum of 10,000 write/erase operations
- Sector erase function (any combination of sectors)
- Sector protect function
- Temporary sector protect cancellation function
- Allows flash memory interface circuit to write to/erase flash memory both under control of external pin by writer and under control of internal bus by CPU.

Embedded Algorithm™ is a registered trademark of Advanced Micro Devices, Inc.

**(2) Block diagrams of Flash Memory**

**a : Block diagram of Flash Memory**

Figure shows the block diagram of the flash memory unit, which has almost the same configuration as the MBM29FLV400C.

**b : Entire block diagram of Flash Memory**

Figure shows the entire block diagram of the Flash Memory with the flash memory interface circuit.

## (3) Write/Erase Modes

The flash memory can be accessed in two different ways; the flash memory mode allowing write/erase directly from the external pins, and the other modes allowing write/erase from the CPU via the internal bus. These modes are selected by the external mode pins.

### a : Flash Memory mode

The CPU stops when the mode pins are set to 111 while the  $\overline{\text{INIT}}$  signal is asserted. The flash memory interface circuit is directly connected to the external bus interface, allowing direct control by the external pins. This mode makes the MCU seem like a standard flash memory at the external pins, and write/erase can be performed using a flash memory programmer.

In the flash memory mode all the operations supported by the flash memory automatic algorithm can be used.

### b : Other modes

The flash memory is located in the  $\overline{\text{CS1}}$  area of the CPU memory space and like ordinary mask ROM can be read-accessed and program-accessed from the CPU through the flash memory interface circuit. After execution of the internal Boot ROM the area for CS1 is set from 180000 to FFFFF (F361GA only) .

Writing/erasing the flash memory is performed by instructions from the CPU via the flash memory interface circuit. Therefore, this mode allows rewriting even when the MCU is soldered on the target board.

The sector protect operations can not be performed in these modes.

### c : Control signals of flash memory

Next table lists the flash memory control signals in the flash memory mode.

There is almost a one-to-one correspondence between the flash memory control signals and the external pins of the MBM29LV400C. The  $V_{\text{ID}}$  (12 V) pins required by the sector protect operations are MD0, MD1 and MD2 instead of A9, RESET and OE for the MBM29LV400C.

In the flash memory mode, the width of the external data bus can be 8 or 16 bit.

## (5) Read/Write Access

In the flash memory mode, read/write access to the flash memory must be under control of the external pins. However, with the CPU access, there are no special timing constraints on read/write access because the flash memory is controlled by the flash memory interface circuit.

In this section, “write access” does not directly mean “program flash memory”. It implies “activation of the flash commands”.

### a : Read/write access in flash memory mode

Next table gives the setting of pins for read/write access in the Flash Memory mode. There is no special problem with control of these pins if connected to a flash memory writer. However, in other cases, timing specifications must be met.

**Setting Conditions of Pins for Read/Write Access in Flash Memory Mode**

Operations	BGRNTX ( $\overline{CE}$ )	RDY ( $\overline{OE}$ )	CS4X ( $\overline{WE}$ )	A0 to A18	D16 to D31	$\overline{INIT}$
Read	L	L	H	Read address	D <sub>OUT</sub>	H
Write	L	H	L	Write address	D <sub>IN</sub>	H
Output disable	L	H	H	x	High-Z	H
Standby	H	x	x	x	High-Z	H
Hardware reset	x	x	x	x	High-Z	L

### b : Read/write access with CPU on F361GA

The access timing to the flash memory unit is controlled by the flash memory interface circuit. Depending on the setting for CLK<sub>T</sub> the read operation can be completed in two or more cycles of CLK<sub>T</sub>.

External Bus clear	Wait cycles
32 MHz	1
24 MHz	1
≤ 16 MHz	0

### c : Read access with CPU on other devices

16	24	0	1	0	2	X2 <sub>H</sub>

# MB91360G Series

## (6) Automatic Write/Erase

Irrespective of the Flash Memory mode or other modes, writing to/erasing the flash memory unit is performed by starting the flash memory automatic algorithm.

To start the automatic algorithm, various sequences of write accesses are executed in 1 to 6 cycles. They are called Flash commands.

### a : Flash Commands

There are four commands for starting the automatic algorithm of the Flash Memory unit; Read/Reset, Write, Chip Erase, and Sector Erase. There are also Erase Suspend and Erase Resume commands for the sector erase operation.

Next tables give the command sequence lists in the flash memory and other modes.

### b : Command sequence

Command Sequence List (CPU access)

Command Sequence	Write Cycle of Bus	First Write Cycle of Bus		Second Write Cycle of Bus		Third Write Cycle of Bus		Fourth Read/Write Cycle of Bus		Fifth Write Cycle of Bus		Sixth Write Cycle of Bus	
		Ad-dress	Data	Ad-dress	Data	Ad-dress	Data	Ad-dress	Data	Ad-dress	Data	Ad-dress	Data
Read/Reset*1	1	*2xxxx	xxF0	—	—	—	—	—	—	—	—	—	—
Read/Reset*1	4	*25554	xxAA	*2aaa8	xx55	*25554	xxF0	RA	RD	—	—	—	—
Write	4	*25554	xxAA	*2aaa8	xx55	*25554	xxA0	PA (even)	PD (word)	—	—	—	—
Chip Erase	6	*25554	xxAA	*2aaa8	xx55	*25554	xx80	*25554	xxAA	*2aaa8	xx55	*25554	xx10
Sector Erase	6	*25554	xxAA	*2aaa8	xx55	*25554	xx80	*25554	xxAA	*2aaa8	xx55	SA (even)	xx30
Sector Erase Suspend	Input of address *2xxxx or data (xxB0H) suspends sector erasing.												
Sector Erase Resume	Input of address *2xxxx or data (xx30H) suspends and resumes sector erasing.												

Addresses in the table are the values in the CPU memory space. All addresses and data are hexadecimal values, where x is any value and \*2 may be 08 to 0F on F362GA/FV360GA, 18 to 1F on F361GA.

\*1 : Read/Reset command reset Flash memory to read mode.

# MB91360G Series

Command Sequence List (Flash Memory Mode)

Command Sequence	Write Cycle of Bus	First Write Cycle of Bus		Second Write Cycle of Bus		Third Write Cycle of Bus		Fourth Read/Write Cycle of Bus		Fifth Write Cycle of Bus		Sixth Write Cycle of Bus	
		Ad-dress	Data	Ad-dress	Data	Ad-dress	Data	Ad-dress	Data	Ad-dress	Data	Ad-dress	Data
Read/Reset*	1	*xxxx	F0	—	—	—	—	—	—	—	—	—	—
Read/Reset*	4	*aaaa	AA	*5554	55	*aaaa	F0	RA	RD	—	—	—	—
Write	4	*aaaa	AA	*5554	55	*aaaa	A0	PA (even)	PD (word)	—	—	—	—
Chip Erase	6	*aaaa	AA	*5554	55	*aaaa	80	*aaaa	AA	*5554	55	*aaaa	10
Sector Erase	6	*aaaa	AA	*5554	55	*aaaa	80	*aaaa	AA	*5554	55	SA (even)	30
Sector Erase Suspend	Input of address *xxxx or data (B0 <sub>H</sub> ) suspends sector erasing.												
Sector Erase Resume	Input of address *xxxx or data (30 <sub>H</sub> ) suspends and resumes sector erasing.												

Addresses in the table are values for writer addresses. All addresses and data are hexadecimal values, where x is any value and \* may be 0 to 7.

RA : Read address

PA : Write address. Only even addresses can be specified.

SA : Sector address (See next table) . Only even addresses can be specified.

RD : Read data

PD : Write data. Only word data can be specified.

# MB91360G Series

Sector Address for half word mode

Sector	A18	A17	A16	A15	A14	A13	Address range
SA13	1	1	1	1	1	—	7C000 <sub>H</sub> to 7FFFF <sub>H</sub>
SA12	1	1	1	1	0	1	7A000 <sub>H</sub> to 7BFFF <sub>H</sub>
SA11	1	1	1	1	0	0	78000 <sub>H</sub> to 79FFF <sub>H</sub>

SA4	0	1	1	1	0	0	38000 <sub>H</sub> to 39FFF <sub>H</sub>
SA3	0	1	1	0	—	—	30000 <sub>H</sub> to 37FFF <sub>H</sub>
SA2	0	1	0	—	—	—	20000 <sub>H</sub> to 2FFFF <sub>H</sub>
SA1	0	0	1	—	—	—	10000 <sub>H</sub> to 1FFFF <sub>H</sub>
SA0	0	0	0	—	—	—	00000 <sub>H</sub> to 0FFFF <sub>H</sub>

## (7) Connection to Flash Memory

The Flash Memory mode of the MB91F361GA is intended mainly for external connection to a flash memory writer. As indicated in Table Flash Control Signals, there is a slight difference between the external pins of the MB91F361GA and the MBM29LV400C (4 Mbit flash memory) . Connection to an MBM29LV400C writer requires the socket adapter.

## (8) Notes to Use of Flash Memory

Notes on the Flash Memory in MB91360G series devices are given below.

### a : Input of hardware reset ( $\overline{\text{INIT}}$ )

To input a hardware reset when the automatic algorithm is not started, where reading is in progress, a minimum of 500 ns should be taken at a low-level width. In this case, a maximum of 500 ns is required until data can be read from the flash memory after a hardware reset has been activated.

Similarly, to input a hardware reset when the automatic algorithm is activated, where writing/erasing is in progress, a minimum of 50 ns should be taken in a low-level width. In this case, 20  $\mu\text{s}$  are required until data can be read after the executing operation has been terminated to initialize the flash memory.

A hardware reset during writing undefined data being written. A hardware reset during erasing may make the sector being erased unusable.

### b : Canceling software reset, watchdog timer reset, and hardware standby

When writing/erasing the flash memory with the CPU access and if reset conditions occur while the automatic algorithm is active, the CPU may run away. This occurs because these reset conditions cause the automatic algorithm to continue without initializing the flash memory unit, possibly preventing the flash memory unit from entering the read state when the CPU starts the sequence after the reset has been deasserted. These reset conditions should be inhibited during writing/erasing the Flash Memory.

### c : Program access to Flash Memory

When the automatic algorithm is operating, read access to the flash memory is disabled. With the memory access mode of the CPU set to the internal ROM mode, writing/erasing should be started after switching the program area to another area such as RAM.

In this case, when sectors containing interrupt vectors are erased, interrupt processing cannot be executed.

For the same reason, all interrupt sources should be disabled while the automatic algorithm is operating.

### d : Hold function

When the CPU accepts a hold request, the Write signal  $\overline{\text{WE}}$  of the flash memory unit may be skewed and many cause erroneous writing/erasing. When the acceptance of a hold request is enabled, ensure that the WE bit of the control status register (FMCS) is 0.

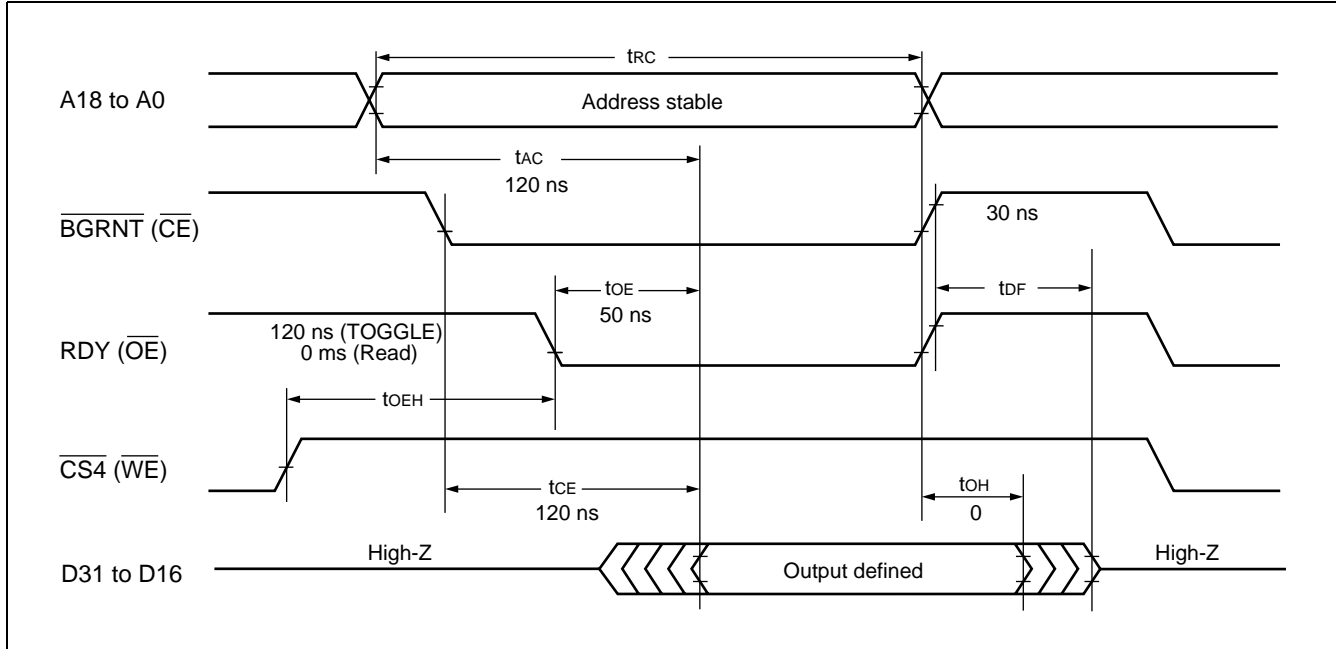

### e : Applying $V_{\text{ID}}$

Applying  $V_{\text{ID}}$  required for the sector protect operation should always be started and terminated when the supply voltage is on.

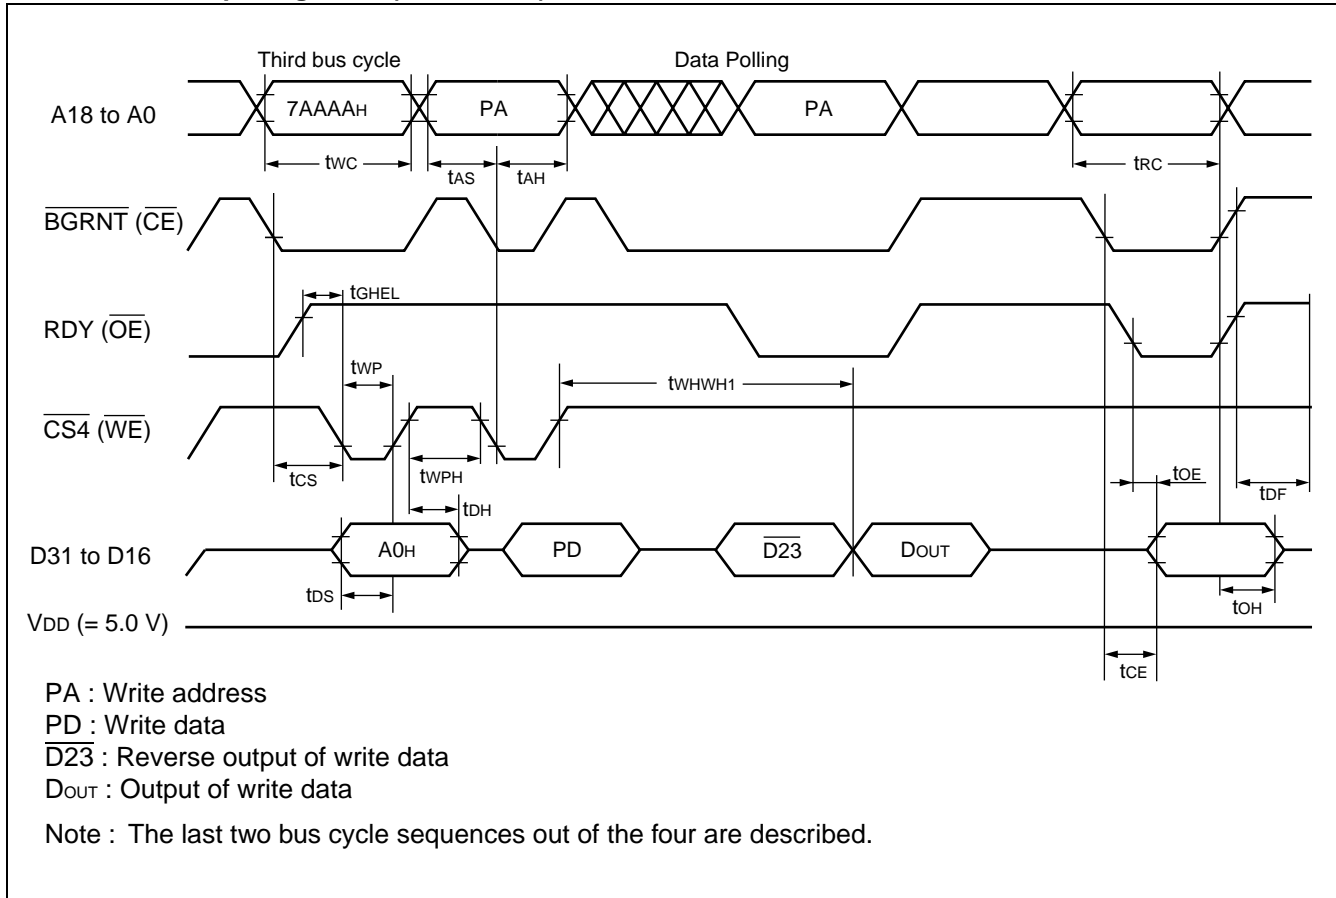

## (9) Timing Diagrams in Flash Mode

Each timing diagram for the external pins of the MB91F361 in the Flash Memory mode is shown below.

### a : Data read by read access

### b : Write Data polling Read ( $\overline{WE}$ control)

# MB91360G Series

## c : Write Data polling Read ( $\overline{\text{CE}}$ control)

PA : Write address

PD : Write data

$\overline{\text{D23}}$  : Reverse output of write data

DOUT : Output of write data

Note : The last two bus cycle sequences out of the four are described.

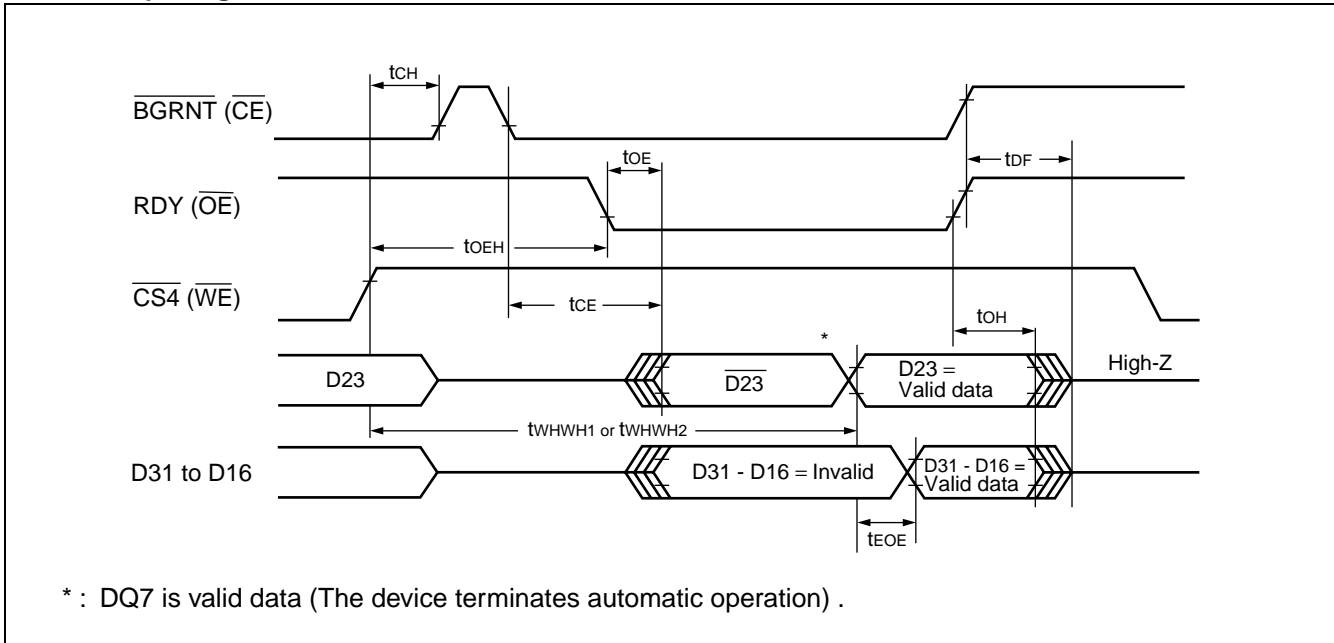

## d : Chip erase/sector erase command sequence

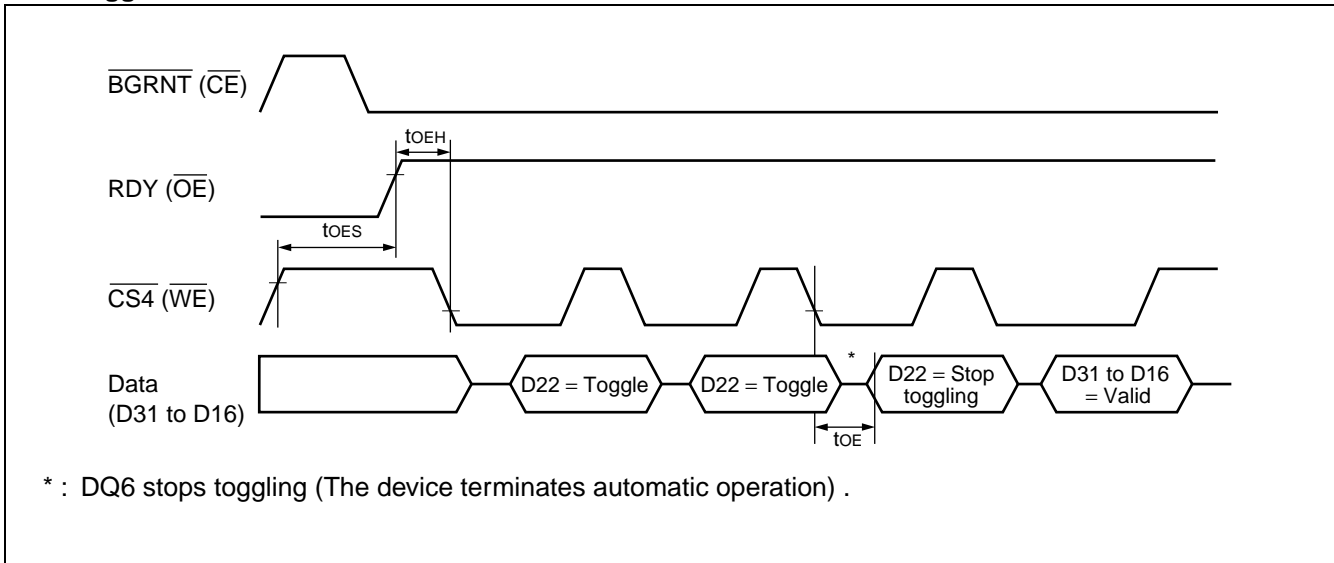

Note : SA is the sector address at sector erasing. 7AAAAH (or 6AAAAH) is the address at chip erasing.

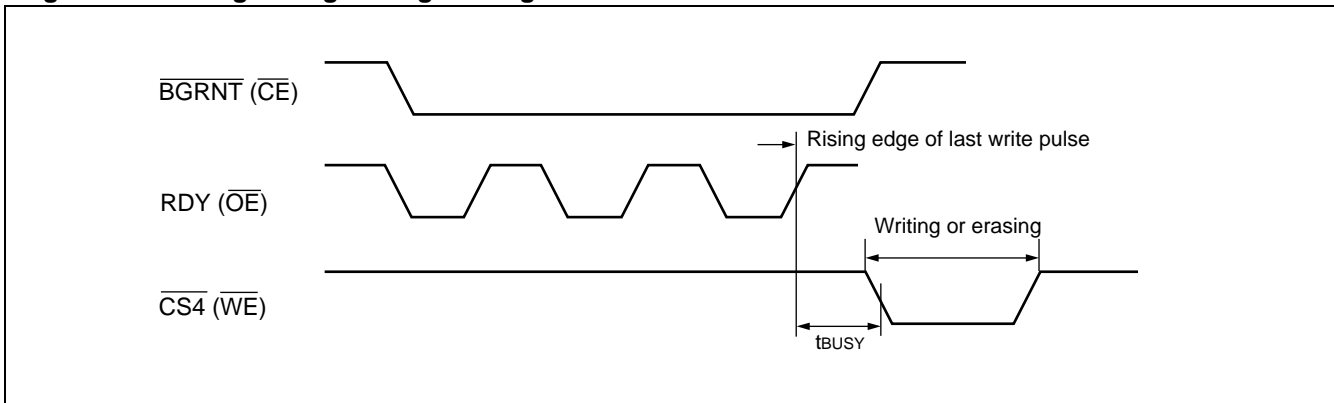

## e : Data polling

## f : Toggle bit

## g : RY/ $\overline{\text{BY}}$ timing during writing/erasing

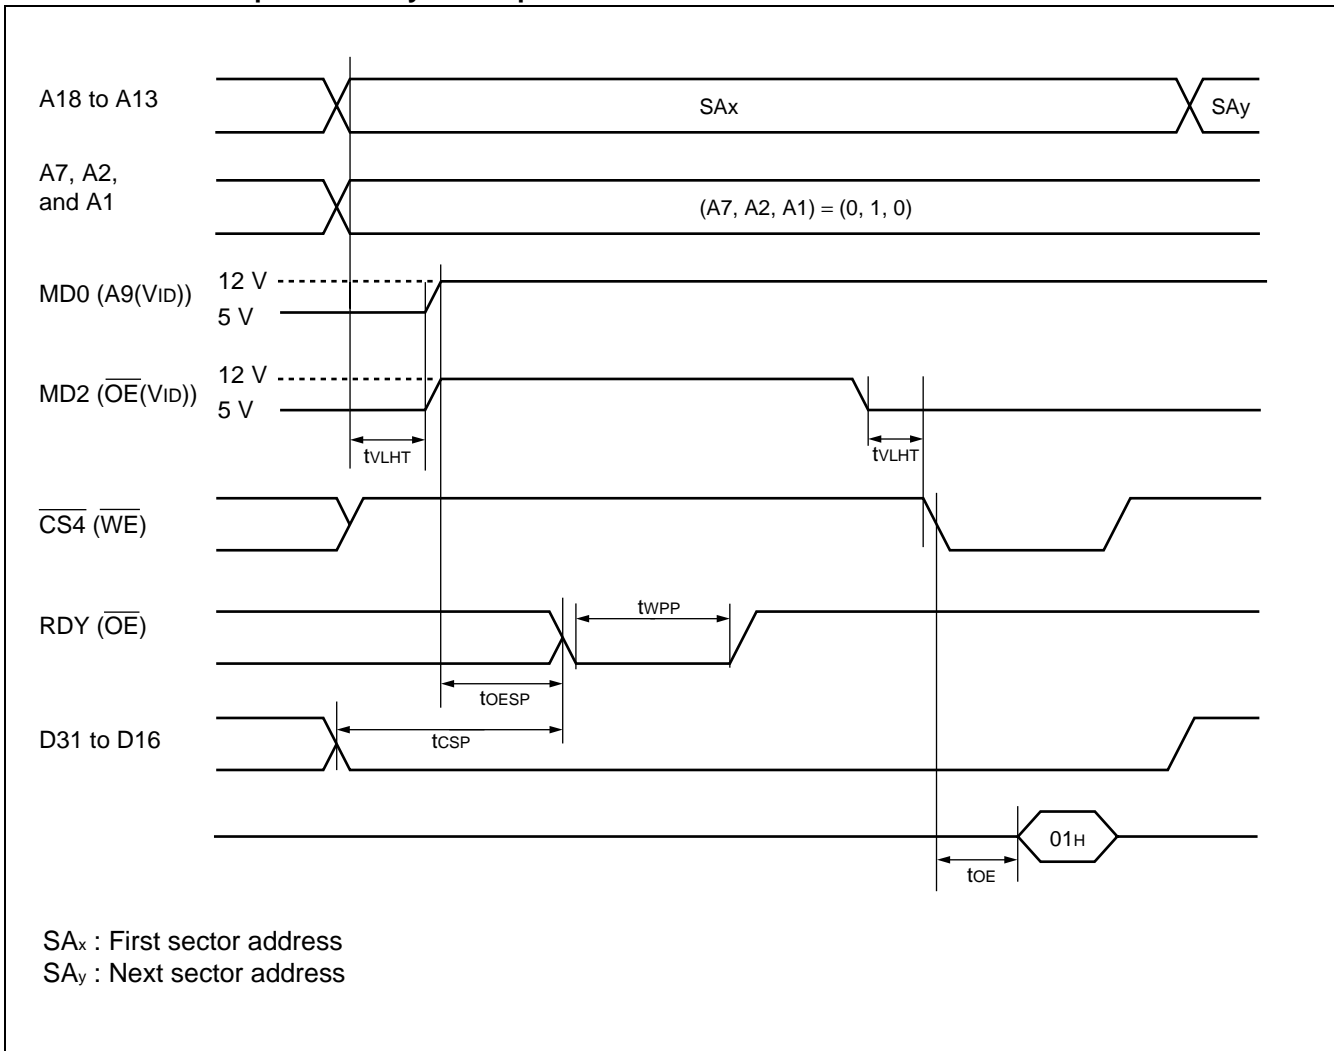

# MB91360G Series

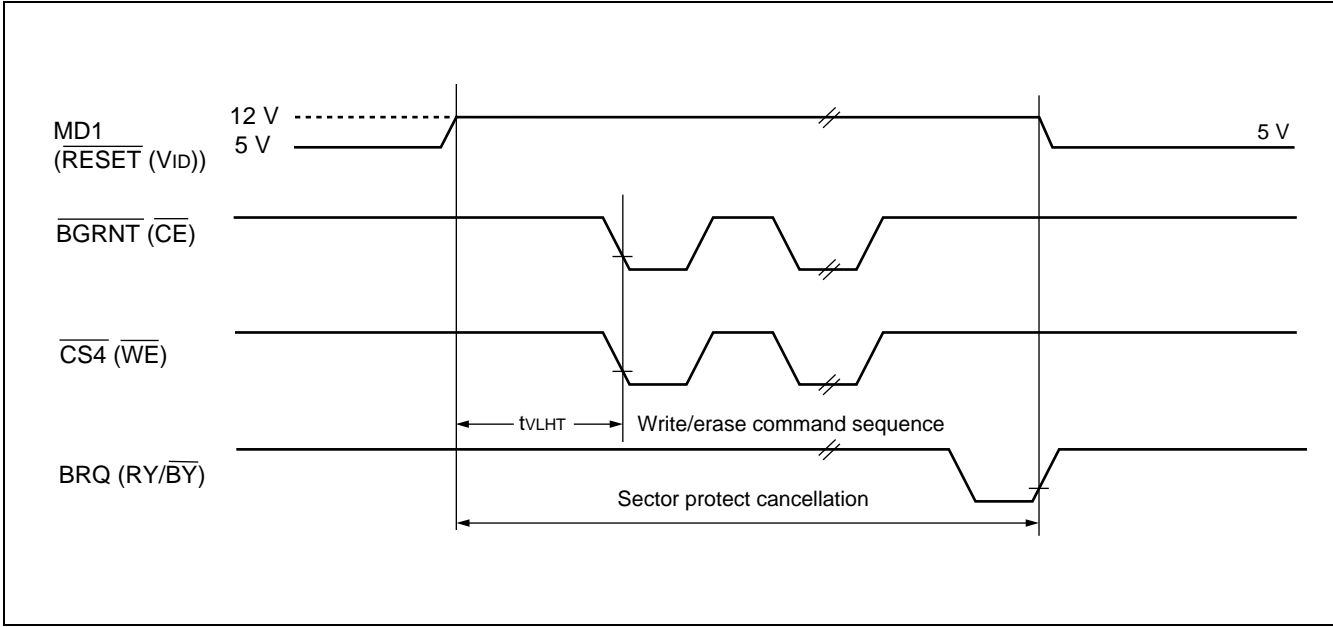

## h : $\overline{\text{INIT}}$ and $\text{RY}/\overline{\text{BY}}$ timing

## i : Enable sector protect/verify sector protect

## j : Temporary sector protect cancellation

# MB91360G Series

## (10) AC Characteristics in Flash Memory Mode

The AC specifications for the external pins of the MB91F361 in the Flash Memory mode are shown below. They apply to the case where the user performs read/write access in the Flash Memory mode. They are not needed for access in the normal mode and for use of a flash memory writer.

The values are subject to change without prior notice.

**a : Read access**

### AC Characteristics for Read Access

(Under recommended conditions)

Parameter	Symbol	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
Read cycle time	$t_{RC}$	—	120	—	—	ns
Address access time	$t_{ACC}$	$\overline{CE} = V_{IL}$ $\overline{OE} = V_{IL}$	—	—	120	ns
$\overline{CE}$ to data output	$t_{CE}$	$\overline{OE} = V_{IL}$	—	—	120	ns
$\overline{OE}$ to data output	$t_{OE}$	—	—	—	50	ns
$\overline{CE}$ to output floating	$t_{DF}$	—	—	—	30	ns
$\overline{OE}$ to output floating	$t_{DF}$	—	—	—	30	ns
Previous cycle data output hold time	$t_{OH}$	—	0	—	—	ns
$\overline{INITI}$ pin to return to read mode	$t_{Ready}$	—	—	—	20	$\mu s$

# MB91360G Series

**b : Write [write/erase command] access ( $\overline{WE}$  control)**

## AC Characteristics for Write Access ( $\overline{WE}$ Control)

(Under recommended conditions)

Parameter	Symbol	Value			Unit
		Min.	Typ.	Max.	
Write cycle time	$t_{WC}$	120	—	—	ns
Address setup time	$t_{AS}$	0	—	—	ns
Address hold time	$t_{AH}$	50	—	—	ns
Data setup time	$t_{DS}$	50	—	—	ns
Data hold time	$t_{DH}$	0	—	—	ns

R <sub>Y</sub> / $\overline{\text{BY}}$ delay until write/erase is enabled	t <sub>busy</sub>	50	—	—	ns	

\* : The internal preprogramming time before erasing is not included.

## ■ ELECTRICAL CHARACTERISTICS

### 1. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Condition
		Min.	Max.		
Digital supply voltage	$V_{DD}-V_{SS}$	-0.3	6.0	V	
Stepper motor control supply voltage	$HV_{DD}-HV_{SS}$	-0.3	6.5	V	
Storage temperature	Tstg	-55	+125	°C	
Power consumption	$P_{TOT}$	—	*1	mW	$T_A = +25^{\circ}\text{C}$
Digital input voltage	$V_{DIG}$	-0.3*2	5.8	V	$V_{SS} = 0\text{ V}, V_{DD} = 5\text{ V}$
Analog input voltage	$V_{IA}$	-0.3	5.8	V	$V_{SSA} = 0\text{ V}, V_{DDA} = 5\text{ V}$
Analog supply voltage	$V_{DDA}-V_{SSA}$	-0.3	5.8	V	$V_{SSA} = 0\text{ V}$
Analog reference voltage	$V_{REFHL}-V_{SSA}$	-0.3	5.8	V	$V_{SSA} = 0\text{ V}$
Static DC current into digital I/O	$I_{I/ODC}$	-2	2	mA	$\Sigma I_{I/ODC} < I_{SRUN}$

\*1 : The value differs in each kind of the product.

\*2 : Making full use of the allowed static DC correct into digital I/O will lead to lower values for  $V_{DIG}$  Min.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

### 2. Recommended Operating Conditions

Parameter	Symbol	Value			Unit	Condition	
		Min.	Typ.	Max.			
Operating temperature	$T_A$	-40		+85	°C		
Supply voltage (Internal voltage regulator)	Digital supply	$V_{DD} - V_{SS}$	4.25*	5	5.25	V	$V_{DDCORE} = 3.3\text{ V}$
	Stepper motor control supply	$HV_{DD} - HV_{SS}$	4.75	5	5.25	V	$HV_{SS} = 0\text{ V}$
	Analog supply	$V_{DDA} - V_{SSA}$	4.9	5	5.1	V	$V_{SSA} = 0\text{ V}$
RAM data retention voltage	$V_{DD} - V_{SS}$	3.0	—	—	V		

\*: This is only valid if the integrated power-down reset circuit is switched-off, else a reset can be triggered at voltages less or equal than 4.5 V (see “■ PERIPHERAL RESOURCES 23. POWER DOWN RESET”).

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

## 4. Run Mode Current/Power Consumption

The power dissipation during normal operation is determined by the total power dissipation of the internal logic  $P_C$ , the dissipation from analog modules  $P_A$  and the power dissipation  $P_{IO}$  of the I/O buffers. Among the I/O buffers the dissipation caused by the stepper motor drivers  $P_{SMC}$  should be taken into special consideration.

So the overall power consumption  $P_D$  will be calculated as a sum of  $P_C + P_A + P_{SMC} + P_{IO}$ .

### (1) Logic Power Consumption

The following formula can be used to calculate the maximum core current consumption when the PLL is used depending on the frequency settings for the internal clocks :

$$I_{CC} = 3.45 \text{ [mA/MHz]} \times CLKB \text{ [MHz]} + 2.52 \text{ [mA/MHz]} \times CLKP \text{ [MHz]} + 0.72 \text{ [mA/MHz]} \times CLKT \text{ [MHz]} + 35.5 \text{ mA.}$$

If clock modulation is used the following value must be added to this result :  $0.24 \text{ [mA/MHz]} \times CLKB \text{ [MHz]}$ .

This results in the following values (higher clock settings are not allowed) :

Clock frequencies [MHz]			Maximum Core Current Consumption [mA]	Logic Power Consumption $P_C$ at 5.25 V [mW]	Remarks
CLKB	CLKP	CLKT			
64	16	16	308	1.70	no clock modulation possible
48	24	24	290	1.52	
48	16	16	264	1.40	
32	32	32	257	1.35	
32	16	16	205	1.08	
24	24	24	202	1.06	
24	12	12	163	0.86	
16	16	16	146	0.77	
2	2	2	40	0.21	no PLL, no clock modulation
0.125	0.125	0.125	30	0.16	no PLL, no clock modulation

In addition to this power consumption of the MCU core logic the following contributions to the overall power consumption have to be considered :

### (2) Analog Power Consumption

Module	Maximum Current Consumption	Remarks
DAC	1 mA / channel	
ADC	7 mA	
Power down reset	0.5 mA	
Alarm Comparator	0.5 mA	

To calculate the analog power consumption  $P_A$ , the current contributions of the active modules have to be multiplied by the maximum analog supply voltage of 5.1 V.

# MB91360G Series

## (3) I/O and SMC Power Consumption

SMC drivers :

The average current consumption per SMC channel is 38.2 mA, for four channels this results in 152.8 mA. At  $2 \times 0.5$  V this results in 153 mW power consumption  $P_{SMC}$  for four channels of stepper motor drivers.

Other I/O Buffers :

The power dissipation ( $P_{IO}$ ) (at 5.25 V) of the I/O buffers is represented as the sum of the dynamic power dissipation ( $P_{AC}$ ) and the static power consumption ( $P_{DC}$ ) .

$$P_{IO} = P_{AC} \times 1.1 + P_{DC}$$

The following table lists values for  $P_{AC}$  :

Buffer Type	Power Consumption	Unit
Normal Input	12.4	$\mu\text{W}/\text{MHz}$ @ 5.0 V
Bidirectional Input		
4 mA Bidirectional Output	$194 + 25 C_L$	
4 mA Output		
8 mA Bidirectional Output	$353 + 25 C_L$	
8 mA Output		

$$P_{AC} = P_{IB} \times I_n \times f \times \text{operating rate} + P_{OB} \times O_n \times f \times \text{operating rate}$$

- $P_{IB}$  : Power Consumption of Input Buffers and Bidirectional Inputs
- $P_{OB}$  : Power Consumption of Output Buffers and Bidirectional Outputs
- $I_n$  : Total number of input buffers and bidirectional buffer inputs
- $O_n$  : Total number of output buffers and bidirectional buffer outputs
- $f$  : System frequency

Operating rate : 1.0 if all buffers are switched simultaneously at system frequency

$P_{DC}$  is the caused by off chip loads which are drawing static currents.

$$P_{DC} = V_O \times I_O \times DC_N$$

- $V_O$  : Output voltage drop - usually 0.4 V
- $I_O$  : Output current - usually 4 mA
- $DC_N$  : Number of output buffers and bidirectional buffers driving off chip loads causing static currents.

## 5. Clock Settings

Clock domain	Clock name	Max. frequency setting	Remark
Core	CLKB	64 MHz	under normal operating conditions (see “4. Run Mode Current/Power Consumption”) *
		32 MHz	for supply voltage between 4.25 and 3.5 V
Resource bus	CLKP	32 MHz	
Ext. Bus	CLKT	32 MHz	
Clock for CAN	CANCLK	32 MHz	

\* : **F361GA** : If the maximum frequency of 64 MHz is set for CLKB, it is not allowed to have an odd division factor for CLKT.

**F362GA** : If the maximum frequency of 64 MHz is set for CLKB and an odd division factor for CLKT (3, 5, 7, 9, 11, 13, 15) has been selected, then the option to create an asymmetrical CLKT must be used (set bit 14 of the F362MD register to “1”) .

## 7. A/D Converter Glossary

- **Resolution**

The smallest change in analog voltage detected by A/D converter.

- **Linearity error**

A deviation of actual conversion characteristic from a line connecting the zero-transition point (between “00 0000 0000” ↔ “00 0000 0001”) to the full-scale transition point (between “11 1111 1110” ↔ “11 1111 1111”) .

- **Differential linearity error**

A deviation of a step voltage for changing the LSB of output code from ideal input voltage.

- **Total error**

A difference between actual value and theoretical value. The overall error includes zero-transition error, full-scale transition error and linearity error.

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB}' \times (N - 1) + 0.5 \text{ LSB}'\}}{1 \text{ LSB}'} \text{ [LSB]}$$

$$V_{OT}' \text{ (Ideal value)} = AVRL + 0.5 \text{ LSB}' \text{ [V]}$$

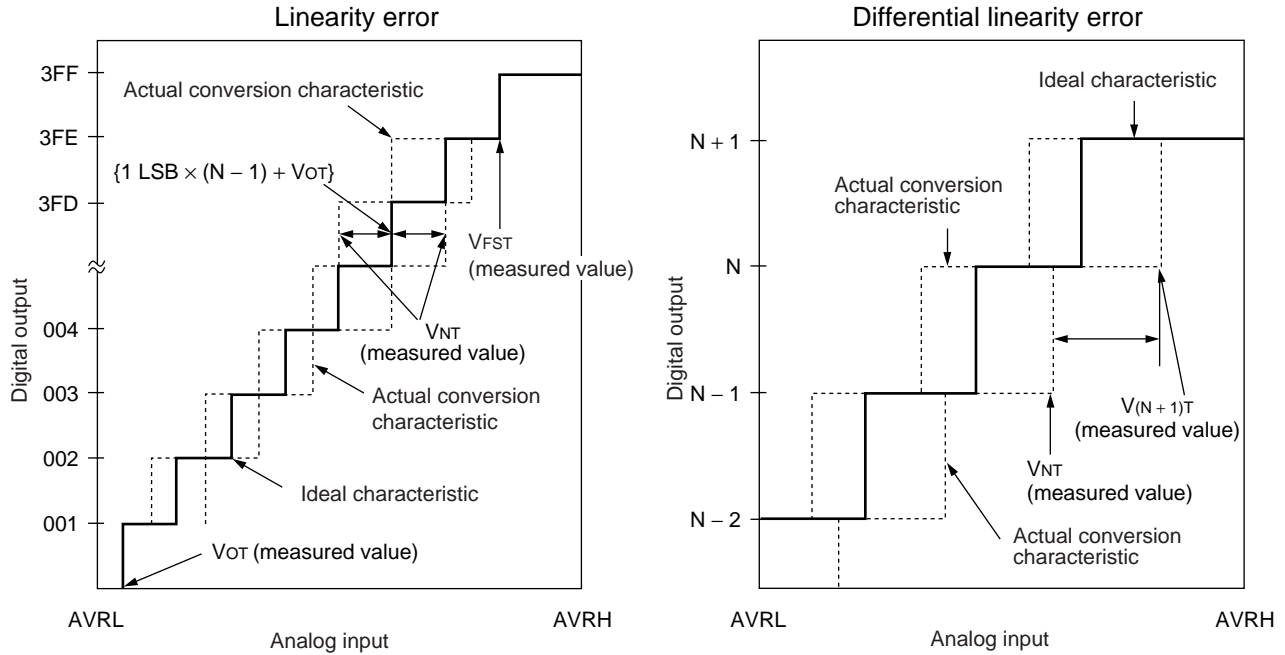

$$V_{FST}' \text{ (Ideal value)} = AVRH - 1.5 \text{ LSB}' \text{ [V]}$$

$V_{NT}$  : A voltage for causing transition of digital output from (N - 1) to N

(Continued)

# MB91360G Series

(Continued)

$$\text{Linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ [LSB]}$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

$$1 \text{ LSB}' \text{ (ideal value)} = \frac{AVRH - AVRL}{1022} \text{ [V]}$$

$V_{OT}$  : A voltage for causing transition of digital output from (000)<sub>H</sub> to (001)<sub>H</sub>

$V_{FST}$  : A voltage for causing transition of digital output from (3FE)<sub>H</sub> to (3FF)<sub>H</sub>

$V_{NT}$  : A voltage for causing transition of digital output from (N - 1)<sub>H</sub> to N

## 8. Notes on Using A/D Converter

Output impedance of external circuit of analog input under following conditions;

Output impedance of external circuit  $< 4 \text{ k}\Omega$

If output impedance of external circuit is too high, analog voltage sampling time may be too short for accurate sampling.

### • Analog input Equivalent Circuit

### • Error

As the absolute value of  $AVRH$  decreases, relative error increases.

# MB91360G Series

## 9. The Time for Power Supply

Parameter	Symbol	Value			Unit
		Min.	Typ.	Max.	
Power supply raising slope	$\Delta V/\Delta t$	—	—	0.05	V/ $\mu$ s
Power supply raising slope	$t_r$	80	—	—	$\mu$ s

## 10. AC Characteristics

### • Measurement conditions

Parameter	Symbol	Value	Unit	Conditions
"H" level input voltage	$V_{IH}$	according to I/O spec	V	$V_{DD} = 4.25$ to $5.25$ V, $T_A = -40$ to $+85$ °C
"L" level input voltage	$V_{IL}$		V	
"H" level output voltage	$V_{OH}$	$0.5 \times V_{DD}$	V	
"L" level output voltage	$V_{OL}$	$0.5 \times V_{DD}$	V	
"H" level input voltage	$V_{IH}$	3.0	V	$V_{DD} = 3.0$ to $3.6$ V, $T_A = -40$ to $+85$ °C
"L" level input voltage	$V_{IL}$	0	V	
"H" level output voltage	$V_{OH}$	$0.5 \times V_{DD}$	V	
"L" level output voltage	$V_{OL}$	$0.5 \times V_{DD}$	V	

### Load conditions

• External bus clock

( $V_{DD} = 4.25\text{ V to }5.25\text{ V}$ ,  $T_A = -40\text{ }^\circ\text{C to }+85\text{ }^\circ\text{C}$ )

Signal	Symbol	Pin name	Value		Unit
			Min.	Max.	
CLK cycle	$t_{CYC}$	CLK	$t_{CPT}$	—	ns
CLK rise → CLK fall	$t_{CHCL}$	CLK	$t_{CYC} / 2 - 10$	$t_{CYC} / 2 + 10$	ns
CLK fall → CLK rise	$t_{CLCH}$	CLK	$t_{CYC} / 2 - 10$	$t_{CYC} / 2 + 10$	ns

Note : This is only valid for operation without clock modulator

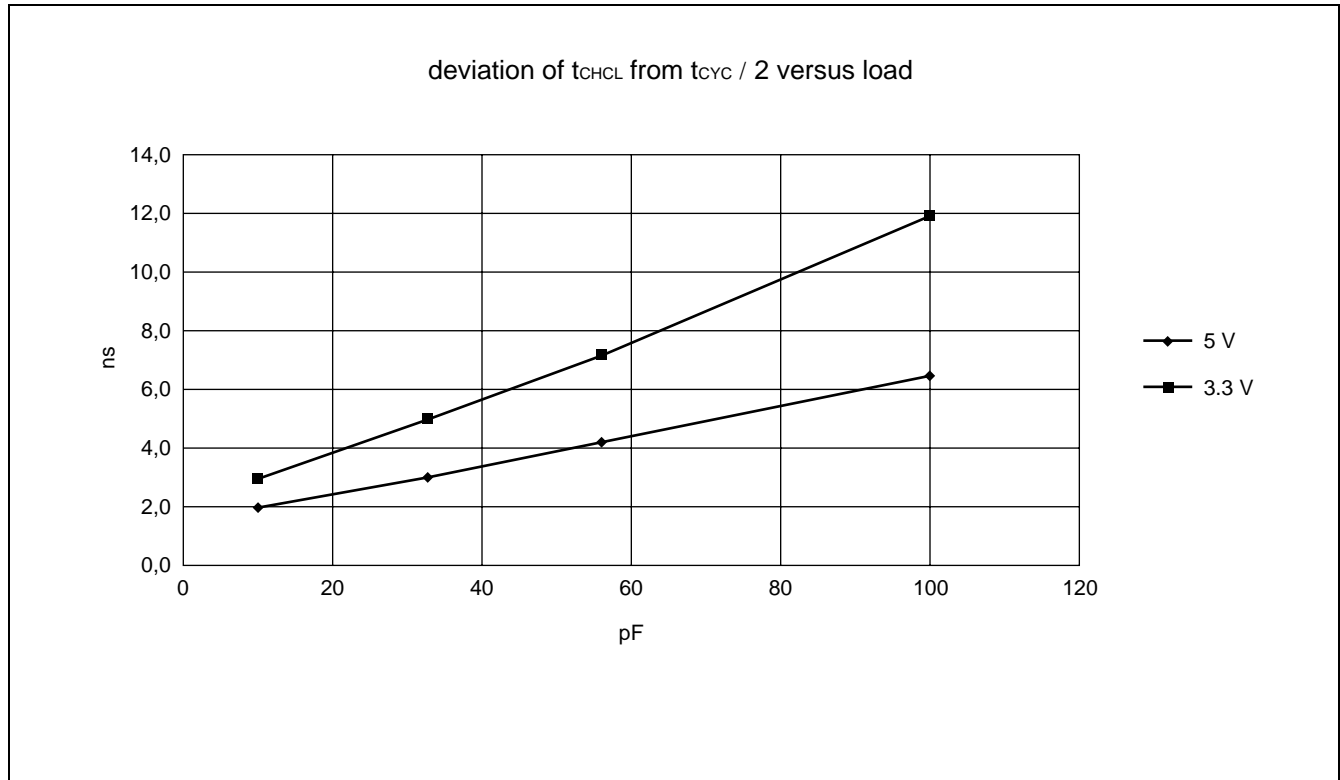

The values for  $t_{CHCL}$  and  $t_{CLCH}$  are heavily dependent on the load connected to the CLK pin. The following diagrams show this dependency for the worst case situation. The first diagram shows the situation for even division ratios between CLKB and CLKT, the second diagram shows this for odd division ratios between CLKB and CLKT (ASYMCLKT bit is not set) .

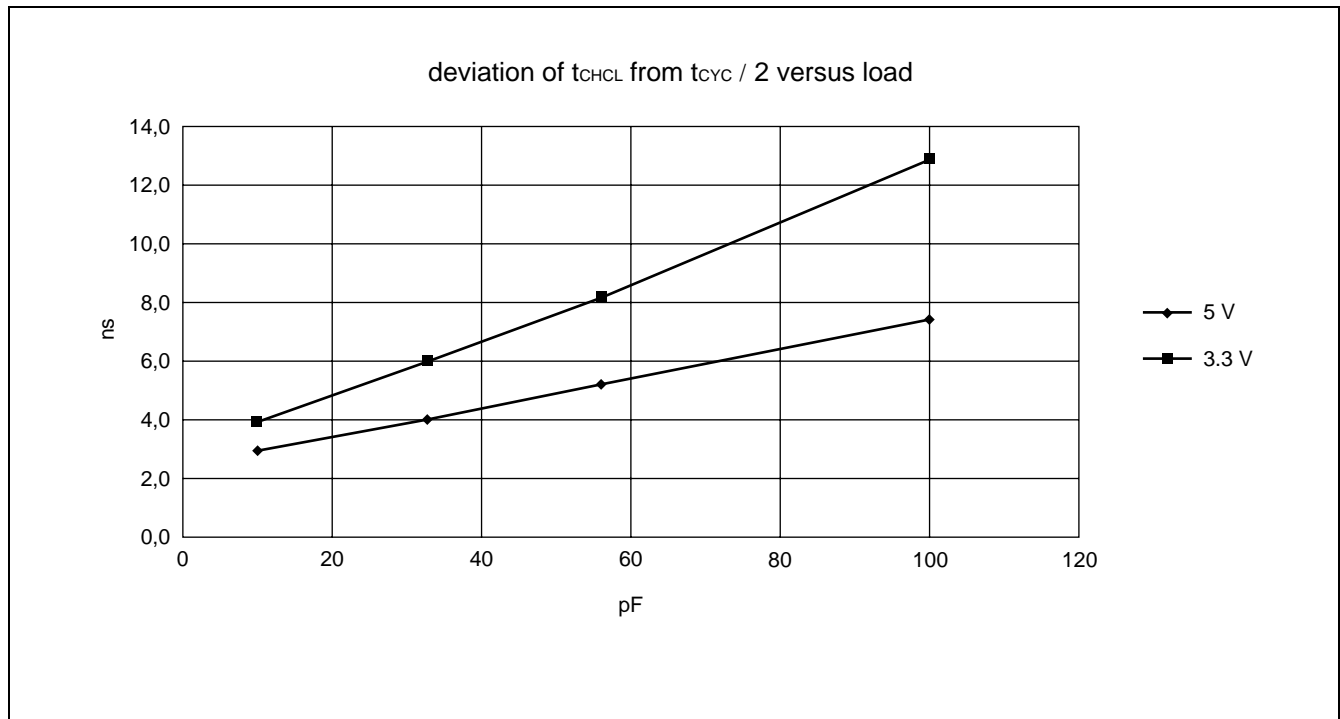

It has to note that when the combination of CLK frequency and load at CLK pin is such that rise or fall times are longer than  $t_{CYC} / 2$  the duty ratio can get worse.

# MB91360G Series

Even CLKB/CLKT division ratios :

Odd CLKB/CLKT division ratios :

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The products described in this document are designed, and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
