General Description

The TC1278/TC1279 are cost-effective system supervisor circuits designed to monitor V_{CC} in digital systems and provide a reset signal to the host processor when necessary. No external components are required. The open-drain output uses an internal pull-up resistor of approximately 6 kΩ.

The reset output is driven active within 5 µs of V_{CC} falling through the reset voltage threshold. RESET is maintained active for a minimum of 250 ms after V_{CC} rises above the reset threshold. The TC1278 has an active-high RESET output, while the TC1279 has an active-low $\overline{\text{RESET}}$ output, with both devices having an open-drain output stage. The output is valid down to V_{CC} = 1.2V. Both devices are available in a 3-Pin SOT- 23 package.

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1: PIN FUNCTION TABLE

Pin No.	Symbol	Function
1	$\overline{\text{RESET}}$ (TC1279)	$\overline{\text{RESET}}$ output
1	RESET (TC1278)	RESET output
2	V_{CC}	Supply voltage (1.2V to 5.5V).
3	GND	Ground.

2.1 $\overline{\text{RESET}}$ (TC1279)

$\overline{\text{RESET}}$ output remains low while V_{CC} is below the reset voltage threshold, and for 350 ms (250 ms min.) after V_{CC} rises above reset threshold. The output stage of the TC1279 is open-drain.

2.2 RESET (TC1278)

RESET output remains high while V_{CC} is below the reset voltage threshold, and for 350 ms (250 ms min.) after V_{CC} rises above reset threshold. The output stage of the TC1278 is open-drain.

2.3 V_{CC}

Supply voltage (1.2V to 5.5V).

2.4 Ground

Device ground.

3.0 APPLICATIONS INFORMATION

3.1 Operation – Power Monitor

The TC1278/TC1279 provide the function of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When V_{CC} is detected as out-of-tolerance, the RESET signal is asserted. On power-up, RESET is kept active for approximately 350 ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before RESET is released.

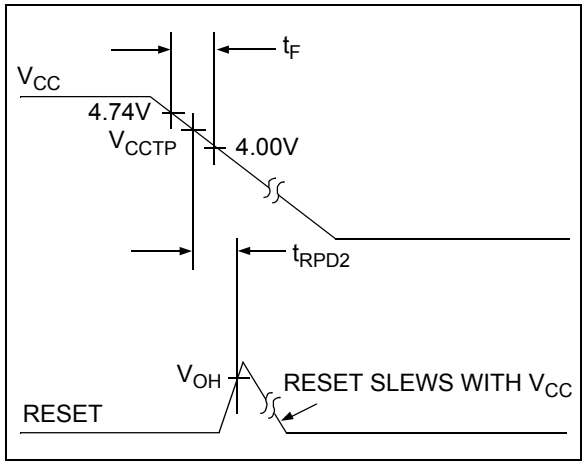

FIGURE 3-4: *TC1278 Power-Down Timing Diagram.*

3.2 V_{CC} Transient Rejection

The TC1278/TC1279 provides accurate V_{CC} monitoring and reset timing during power-up, power-down, and brownout/sag conditions. Furthermore, it rejects negative-going transients (glitches) on the power supply line. Figure 3-5 shows the maximum transient duration vs. maximum negative excursion (overdrive) for glitch rejection. Any combination of duration and overdrive that lays under the curve will not generate a reset signal. Combinations above the curve are detected as a brownout or power-down. Transient immunity can be improved by adding a capacitor in close proximity to the V_{CC} pin of the TC1278/TC1279.
