A. The value of R_{gJA} is measured with the device mounted on 1in² FR-4 board with 2oz. Copper, in a still air environment with $T_A=25^\circ\text{ C}$. The value in any given application depends on the user's specific board design.

B. The power dissipation P_D is based on $T_{J(\text{MAX})}=150^\circ\text{ C}$, using $\leq 10\text{s}$ junction-to-ambient thermal resistance.

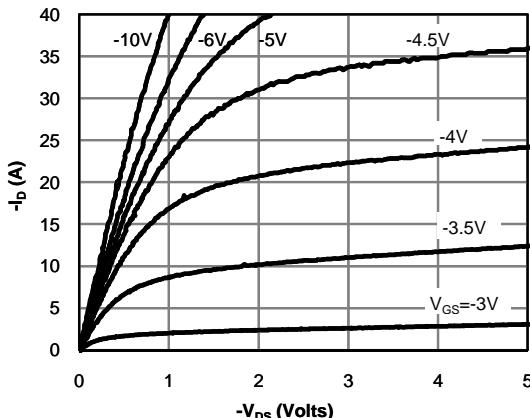

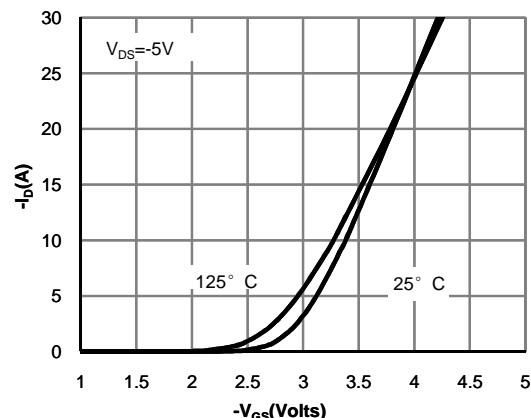

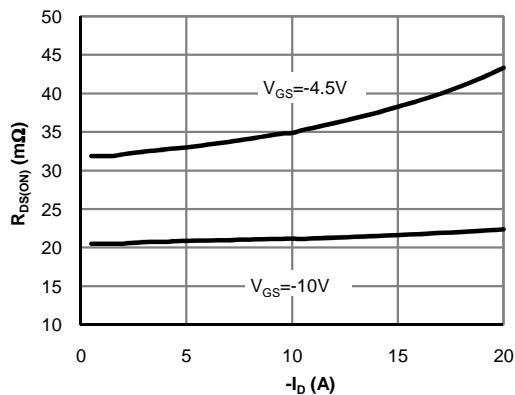

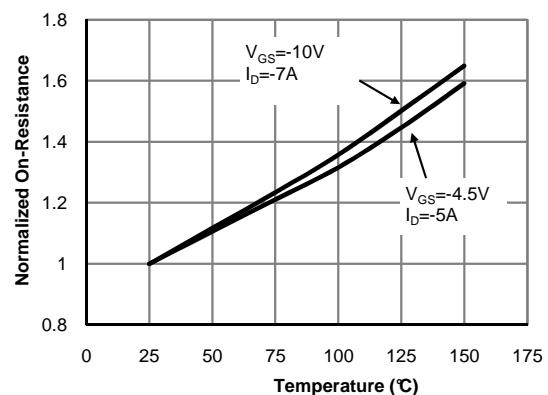

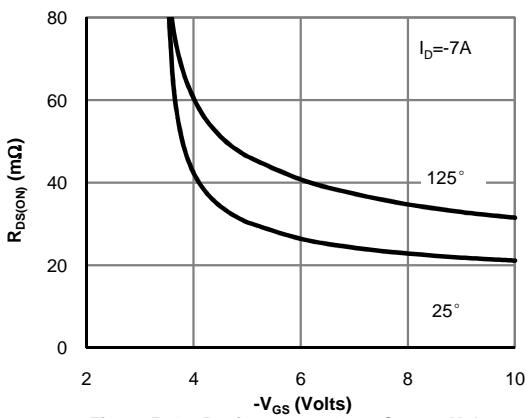

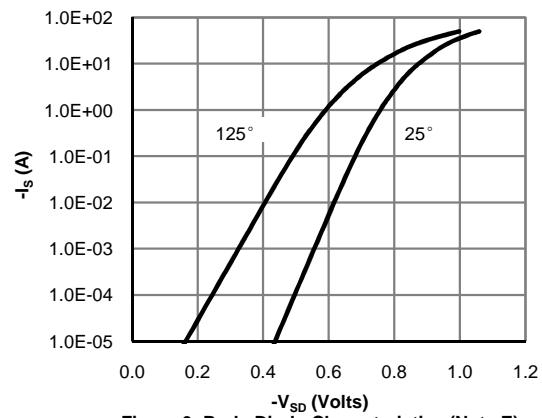

C. Repetitive rating, pulse width limited by junction temperature $T_{J(\text{MAX})}=150^\circ\text{ C}$. Ratings are based on low frequency and duty cycles to keep initial $T_J=25^\circ\text{ C}$.

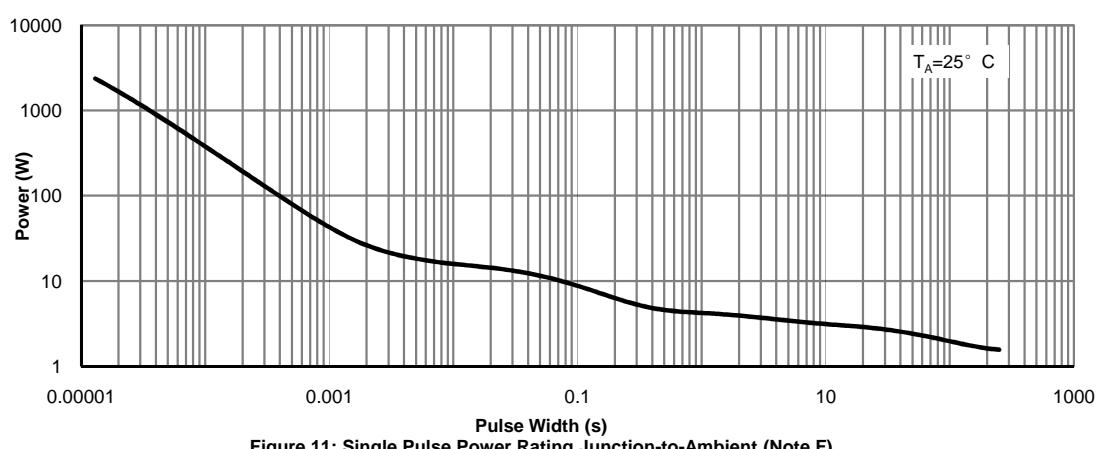

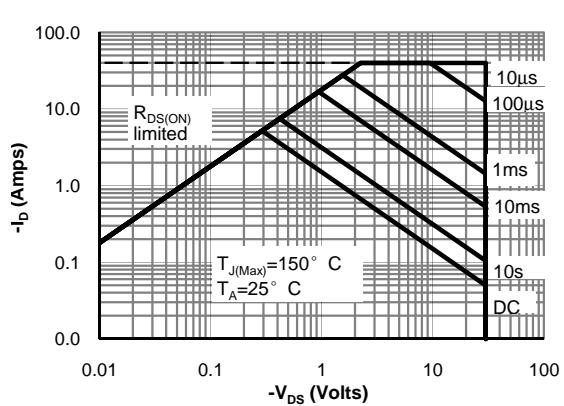

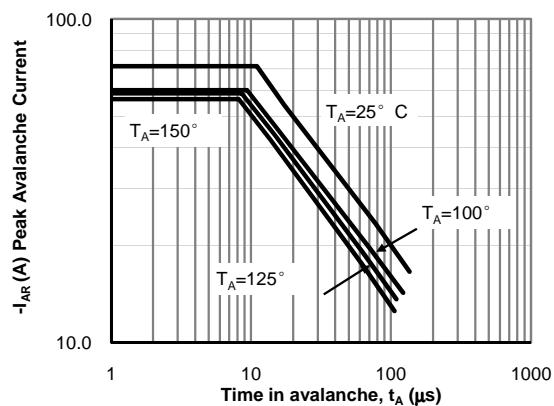

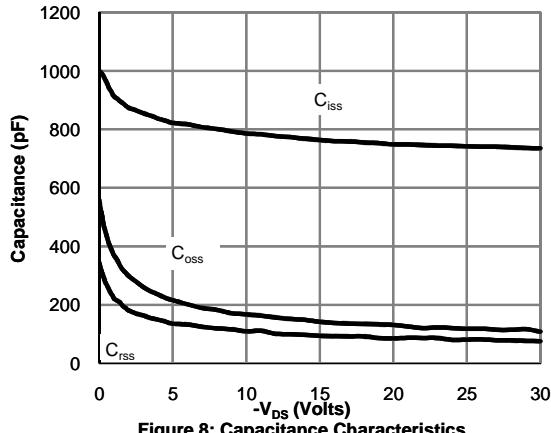

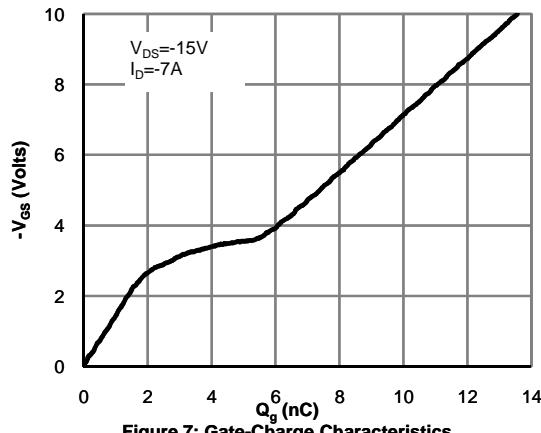

D. The R_{gJA} is the sum of the thermal impedance from junction to lead R_{gJL} and lead to ambient.

E. The static characteristics in Figures 1 to 6 are obtained using $<300\mu\text{s}$ pulses, duty cycle 0.5% max.

F. These curves are based on the junction-to-ambient thermal impedance which is measured with the device mounted on 1in² FR-4 board with 2oz. Copper, assuming a maximum junction temperature of $T_{J(\text{MAX})}=150^\circ\text{ C}$. The SOA curve provides a single pulse rating.
