

# Agilent HDMP-0422

## Single Port Bypass Circuit with CDR & Data Valid Detection Capability for Fibre Channel Arbitrated Loops

### Data Sheet

#### Description

The HDMP-0422 is a Single Port Bypass Circuit (PBC) with Clock and Data Recovery (CDR) capability included. This integrated circuit provides a low-cost, low-power physical-layer solution for Fibre Channel Arbitrated Loop (FC-AL) disk array configurations. By using a PBC such as the HDMP-0422, hard disks may be pulled out or swapped while other disks in the array are available to the system.

A PBC consists of multiple 2:1 multiplexers daisy chained along with a CDR. Each port has two modes of operation: “disk in loop” and “disk bypassed.” When the “disk in loop” mode is selected, the loop goes into and out of the disk drive at that port. For example, data goes from the HDMP-0422’s TO\_NODE[n]± differential output pins to the Disk Drive Transceiver IC’s (e.g. an HDMP-1636A) Rx differential input pins. Data from the Disk Drive Transceiver IC’s Tx differential outputs goes to the HDMP-0422’s FM\_NODE[n]± differential input pins. Figures 2 and 3 show connection diagrams for disk drive array applications.

When the “disk bypassed” mode is selected, the disk drive is either absent or non-functional and the loop bypasses the hard disk.

The “disk bypassed” mode is enabled by pulling the BYPASS[n]- pin low. Leave BYPASS[n]- floating to enable the “disk in loop” mode. HDMP-0422s may be cascaded with other members of the HDMP-04XX/HDMP-05XX family through the appropriate FM\_NODE[n]± and TO\_NODE[n]± pins to accommodate any number of hard disks (see Figure 4). The unused cells in the HDMP-0422 may be bypassed by using pulldown resistors on the BYPASS[n]- pins for these cells.

An HDMP-0422 may also be used as two 1:1 buffers, one with a CDR and one without. For example, an HDMP-0422 may be placed in front of a CMOS ASIC to clean the jitter of the outgoing signal (CDR path) and to better read the incoming signal (non-CDR paths). In addition, the HDMP-0422 may be configured as one 2:1 multiplexers or as one 1:2 buffers.

#### Features

- Supports 1.0625 GBd Fibre Channel operation
- Supports 1.25 GBd Gigabit Ethernet (GE) operation
- Single PBC/CDR in one package
- CDR location determined by choice of cable input/output
- Amplitude valid and data valid detection (Fibre channel rate only) on FM\_NODE[0] input
- Equalizers on all inputs
- High-speed LVPECL I/O
- Buffered Line Logic (BLL) outputs (no external bias resistors required)
- 0.46 W typical power at Vcc = 3.3 V
- 24 Pin, low-cost SSOP package

#### Applications

- RAID, JBOD, BTS cabinets
- One 2:1 muxes
- One 1:2 buffers
- 1 ≥ N Gigabit serial buffer
- N ≥ 1 Gigabit serial mux

**CAUTION:** As with all semiconductor ICs, it is advised that normal static precautions be taken in the handling and assembly of this component to prevent damage and/or degradation which may be induced by electrostatic discharge (ESD).

Agilent Technologies

resistor. The value of the termination resistor should match the PCB trace differential impedance.

#### EQU INPUT

All FM\_NODE[n] $\pm$  high-speed differential inputs have an Equalization (EQU) buffer to offset the effects of skin loss and dispersion on PCBs. An external termination resistor is required across all high-speed inputs. The value of the termination resistor should match the PCB trace differential impedance. Alternatively, instead of a single resistor, two resistors in series, with an AC ground between them, can be connected differentially across the FM\_NODE[n] $\pm$  inputs. The latter configuration attenuates high-frequency common mode noise.

#### BYPASS[n]- INPUT

The active low BYPASS[n]- inputs control the data flow through the HDMP-0422. All BYPASS pins are LVTTTL and contain internal pull-up circuitry. To bypass a port, the appropriate BYPASS[n]- pin should be connected to GND through a 1 k $\Omega$  resistor. Otherwise, the BYPASS[n]- inputs should be left to float, as the internal pull-up circuitry will force them high.

#### FM\_NODE[0]\_DV OUTPUT

The Data Valid (DV) block detects if the incoming data at FM\_NODE[0] $\pm$  is valid Fibre Channel data. The DV block checks for sufficient K28.5+ characters (per Fibre Channel framing rules) and for run length violations (per 8B/10B encoding) on the data coming out of the CDR.

The FM\_NODE[0]\_DV output is pulled low if a run length violation (RLV) occurs, or if there are no commas detected (NCD) over a specific time interval. It is pulled high if no errors are detected.

A RLV error is defined as any consecutive sequence of 1s or 0s greater than five in the serial bit stream. An NCD error indicates the absence of the seven-bit pattern (0011111) present in the positive disparity comma (K28.5+) character. A K28.5+ character should occur at the beginning of every Fibre Channel frame of 2148 bytes (or 21480 serial bits), as well as many times within and between frames. If this seven-bit pattern is not found within a 215 bit ( $\sim 31 \mu s$ ) interval, an NCD error is generated. A counter within the chip tracks the 2<sup>15</sup> bit intervals.

Any RLV and NCD errors are stored during the 2<sup>15</sup> bit interval. The FM\_NODE[0]\_DV output is pulled low at the start of the 2<sup>15</sup> bit interval after errors are detected. Once low, FM\_NODE[0]\_DV remains in that state until an entire 2<sup>15</sup> bit interval has no RLV or NCD errors. At the start of the 2<sup>15</sup> bit interval subsequent to no RLV or NCD errors being detected, FM\_NODE[0]\_DV is pulled high.

#### MODE\_DV INPUT

The active high Data Valid Mode input selects Fibre Channel data checking of the FM\_NODE[0] $\pm$  inputs. This is accomplished by having MODE\_DV override the BYPASS[0]- control (see Figure 1), thereby forcing the data into the CDR to come from the FM\_NODE[0] $\pm$  inputs. The

MODE\_DV pin is an LVTTTL input and contains internal pull-up circuitry. To select Data Valid Mode, float MODE\_DV high. Otherwise, MODE\_DV should be connected to GND through a 1 k $\Omega$  resistor.

When MODE\_DV is high, the user is able to use the BYPASS[0]- input to bypass invalid Fibre Channel data from the rest of the loop. For example, if FM\_NODE[0]\_DV is connected to the BYPASS[0]- input, data from the CDR will only be routed to TO\_NODE[1] $\pm$  if the data has no RLV or NCD errors. If the DV block detects errors, the signal at TO\_NODE[0] $\pm$  will be routed to the TO\_NODE[1] $\pm$  outputs (see Figure 5).

#### FM\_NODE[0]\_AV OUTPUT

The Amplitude Valid (AV) block detects if the incoming data on FM\_NODE[0] $\pm$  is valid by examining the differential amplitude of that input. The incoming data is considered valid, and FM\_NODE[0]\_AV is driven high, as long as the amplitude is greater than 400 mV (differential peak-to-peak). FM\_NODE[0]\_AV is driven low as long as the amplitude of the input signal is less than 100 mV (differential peak-to-peak). When the amplitude of the input signal is between 100-400 mV (differential peak-to-peak), the FM\_NODE[0]\_AV output is undefined.

**Table 1. Pin Connection Diagram to Achieve Desired CDR Location**  
(see Figures 2, 3)

Hard Disks	A	A
Connection to PBC cells	1	0
CDR position (x)	xA	Ax
Cell connected to Cable	0	1

x denotes CDR position with respect to hard disks.

#### I/O Type Definitions

I/O Type	Definition
I-LVTTL	LVTTL Input
O-LVTTL	LVTTL Output
HS_OUT	High Speed Output, LVPECL compatible
HS_IN	High Speed Input
C	External Circuit Node
S	Power Supply or Ground

Pin Name	Pin	Pin Type	Pin Description
TO_NODE[0]+	20	HS_OUT	<b>Serial Data Outputs:</b> High-speed outputs to a hard disk drive or to a cable.
TO_NODE[0]-	21		
TO_NODE[1]+	05		
TO_NODE[1]-	04		
FM_NODE[0]+	23	HS_IN	<b>Serial Data Inputs:</b> High-speed inputs from a hard disk drive or from a cable.
FM_NODE[0]-	24		
FM_NODE[1]+	02		
FM_NODE[1]-	01		
BYPASS[0]-	17	I-LVTTL	<b>Bypass Inputs:</b> For “disk bypassed” mode, connect BYPASS[n]- to GND through a 1 kΩ resistor. For “disk in loop” mode, float HIGH.
BYPASS[1]-	08		
REFCLK	14	I-LVTTL	<b>Reference Clock:</b> A user-supplied clock reference used for frequency acquisition in the Clock and Data Recovery (CDR) circuit.
CPLL1	12	C	<b>Loop Filter Capacitor:</b> A loop filter capacitor for the internal Clock and Data Recovery (CDR) circuit must be connected across the CPLL1 and CPLL0 pins. Recommended value is 0.1 μF.
CPLL0	13		
FM_NODE[0]_DV	09	O-LVTTL	<b>Data Valid:</b> Indicates Fibre Channel compliant data on FM_NODE[n] ± inputs when HIGH. Indicates either a run length violation or a no comma detected error when LOW.
MODE_DV	11	I-LVTTL	<b>Data Valid Mode:</b> To allow data valid detection, float MODE_DV HIGH. Otherwise, connect to GND through a 1 kΩ resistor.
FM_NODE[0]_AV	16	O-LVTTL	<b>Amplitude Valid:</b> Indicates acceptable signal amplitude on the FM_NODE[n]± inputs. If (FM_NODE[n]+ – FM_NODE[n]-) >= 400 mV peak-to-peak, FM_NODE[0]_AV = 1 If 400 mV > (FM_NODE[n]+ – FM_NODE[n]-) > 100 mV, FM_NODE[0]_AV = undefined If 100 mV >= (FM_NODE[n]+ – FM_NODE[n]-), FM_NODE[0]_AV = 0
GND	06 07 18 19	S	<b>Ground:</b> Normally 0 V. See Figure 13 for Recommended Power Supply Filtering.
VccA	15	S	<b>Analog Power Supply:</b> Normally 3.3 V. Used to provide a clean supply to the Clock and Data Recovery (CDR) circuit. See Figure 13 for Recommended Power Supply Filtering.
VccHS[0]	22	S	<b>High Speed Supply:</b> Normally 3.3 V. Used only for high-speed outputs (TO_NODE[n]). See Figure 13 for Recommended Power Supply Filtering.
VccHS[1]	03	S	
Vcc	10	S	<b>Logic Power Supply:</b> Normally 3.3 V. Used for internal logic. See Figure 13 for Recommended Power Supply Filtering.

**Absolute Maximum Ratings**

$T_A = 25^\circ\text{C}$ , except as specified. Operation in excess of any of these conditions may result in permanent damage to this device. Continuous operation at these minimum or maximum ratings is not recommended.

Symbol	Parameter	Units	Min.	Max.
$V_{CC}$	Supply Voltage	V	-0.5	4.0
$V_{IN,LVTTL}$	LVTTL Input Voltage	V	-0.5	$V_{CC} + 0.5^{[1]}$
$V_{IN,HS\_IN}$	HS_IN Input Voltage (Differential)	mV	200	2000
$I_{O,LVTTL}$	LVTTL Output Sink/Source Current	mA		$\pm 13$
$T_{stg}$	Storage Temperature	$^\circ\text{C}$	-65	+150
$T_j$	Junction Temperature	$^\circ\text{C}$	0	+125

**Note:**

1. Must remain less than or equal to absolute maximum  $V_{CC}$  voltage of 4.0 V.

**DC Electrical Specifications**

$V_{CC} = 3.15\text{ V to }3.45\text{ V}$ .

Symbol	Parameter	Units	Min.	Typ.	Max.
$V_{IH,LVTTL}$	LVTTL Input High Voltage Range	V	2.0		
$V_{IL,LVTTL}$	LVTTL Input Low Voltage Range	V			0.8
$V_{OH,LVTTL}$	LVTTL Output High Voltage Range, $I_{OH} = -400\text{ }\mu\text{A}$	V	2.2		$V_{CC}$
$V_{OL,LVTTL}$	LVTTL Output Low Voltage Level, $I_{OL} = 1\text{ mA}$	V	0		0.6
$I_{IH,LVTTL}$	Input High Current (Magnitude), $V_{IN} = 2.4\text{ V}$ , $V_{CC} = 3.45\text{ V}$	$\mu\text{A}$			40
$I_{IL,LVTTL}$	Input Low Current (Magnitude), $V_{IN} = 0.4\text{ V}$ , $V_{CC} = 3.45\text{ V}$	$\mu\text{A}$			-600
$I_{CC}$	Total Supply Current, $T_A = 25^\circ\text{C}$	mA		140	

**AC Electrical Specifications**

$V_{CC} = 3.15\text{ V to }3.45\text{ V}$ .

Symbol	Parameter	Units	Min.	Typ.	Max.
$T_{LOOP\_LAT}$	Total Loop Latency from FM_NODE[0] to TO_NODE[0]	ns		3.0	
$T_{CELL\_LAT}$	Per Cell Latency from FM_NODE[1] to TO_NODE[0]	ns		2.0	
$t_{r,LVTTLin}$	Input LVTTL Rise Time Requirement, 0.8 V to 2.0 V	ns		2.0	
$t_{f,LVTTLin}$	Input LVTTL Fall Time Requirement, 2.0 V to 0.8 V	ns		2.0	
$t_{r,LVTTLout}$	Output TTL Rise Time, 0.8 V to 2.0 V, 10 pF Load	ns		1.7	3.3
$t_{f,LVTTLout}$	Output TLL Fall Time, 2.0 V to 0.8 V, 10 pF Load	ns		1.7	2.4
$t_{rs,HS\_OUT}$	HS_OUT Single-Ended Rise Time, 20% to 80%	ps		200	300
$t_{fs,HS\_OUT}$	HS_OUT Single-Ended Fall Time, 20% to 80%	ps		200	300
$t_{rd,HS\_OUT}$	HS_OUT Differential Rise Time, 20% to 80%	ps		200	300
$t_{fd,HS\_OUT}$	HS_OUT Differential Fall Time, 20% to 80%	ps		200	300
$V_{IP,HS\_IN}$	HS_IN Required Pk-Pk Differential Input Voltage	mV	200	1200	2000
$V_{OP,HS\_OUT}$	HS_OUT Pk-Pk Differential Output Voltage ( $Z_0 = 75\text{ }\Omega$ , Figure 10)	mV	1100	1400	2000

### Guaranteed Operating Rates

$V_{CC} = 3.15 \text{ V}$  to  $3.45 \text{ V}$ .

FC Serial Clock Rate (MBd)		GE Serial Clock Rate (MBd)	
Min.	Max.	Min.	Max.
1,040	1,080	1,240	1,260

### CDR Reference Clock Requirements

$V_{CC} = 3.15 \text{ V}$  to  $3.45 \text{ V}$ .

Symbol	Parameter	Units	Min.	Typ.	Max.
f	Nominal Frequency (Fibre Channel)	MHz		106.25	
f	Nominal Frequency (Gigabit Ethernet)	MHz		125	
F <sub>tol</sub>	Frequency Tolerance	ppm	-100		+100
Symm	Symmetry (Duty Cycle)	%	40		60

### Locking Characteristics

$V_{CC} = 3.15 \text{ V}$  to  $3.45 \text{ V}$ .

Parameter	Units	Max.
Bit Sync Time (phase lock)	bits	2500
Frequency Lock at Powerup	$\mu\text{s}$	500

### Output Jitter Characteristics

$V_{CC} = 3.15 \text{ V}$  to  $3.45 \text{ V}$ .

Symbol	Parameter	Units	Typ.	Max.
RJ <sup>[1]</sup>	Random Jitter at TO_NODE pins (1 sigma rms)	ps	5	
DJ <sup>[1]</sup>	Deterministic Jitter at TO_NODE pins (pk-pk)	ps	20	

#### Note:

1. Please refer to Figures 7 and 8 for jitter measurement setup information.

**Figure 6.** Eye diagram of TO\_NODE[1]± high speed differential output (50  $\Omega$  termination).

Note: Measurement taken with a  $2^7$ -1 PRBS input to FM\_NODE[0]±

## Jitter Measurement Configurations

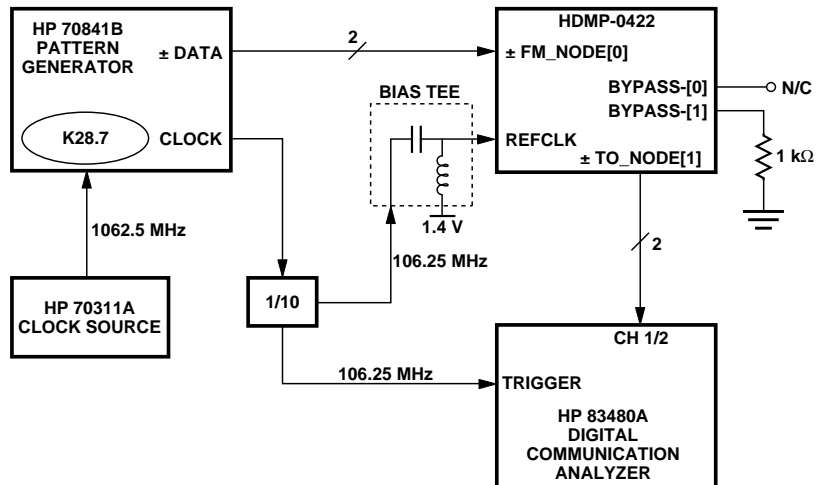

Figure 7. Setup for measurement of Random Jitter.

Figure 8. Setup for measurement of Deterministic Jitter.

## Simplified I/O Cells

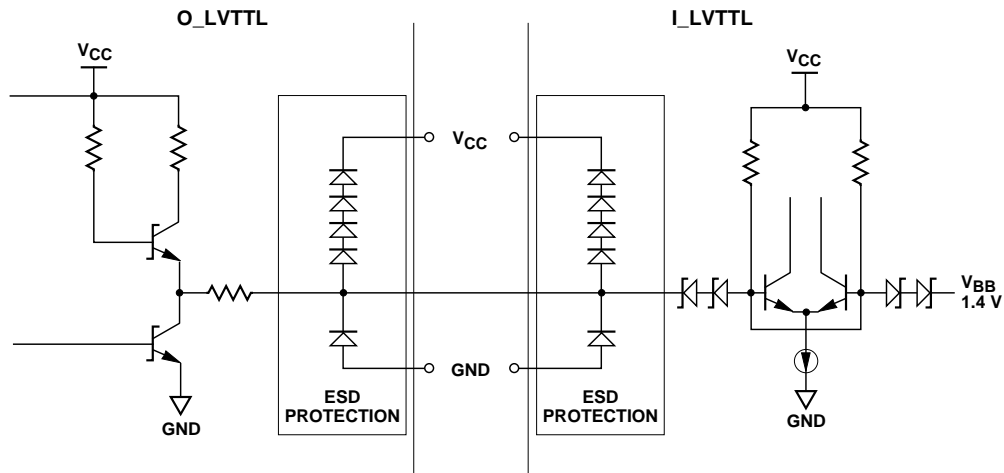

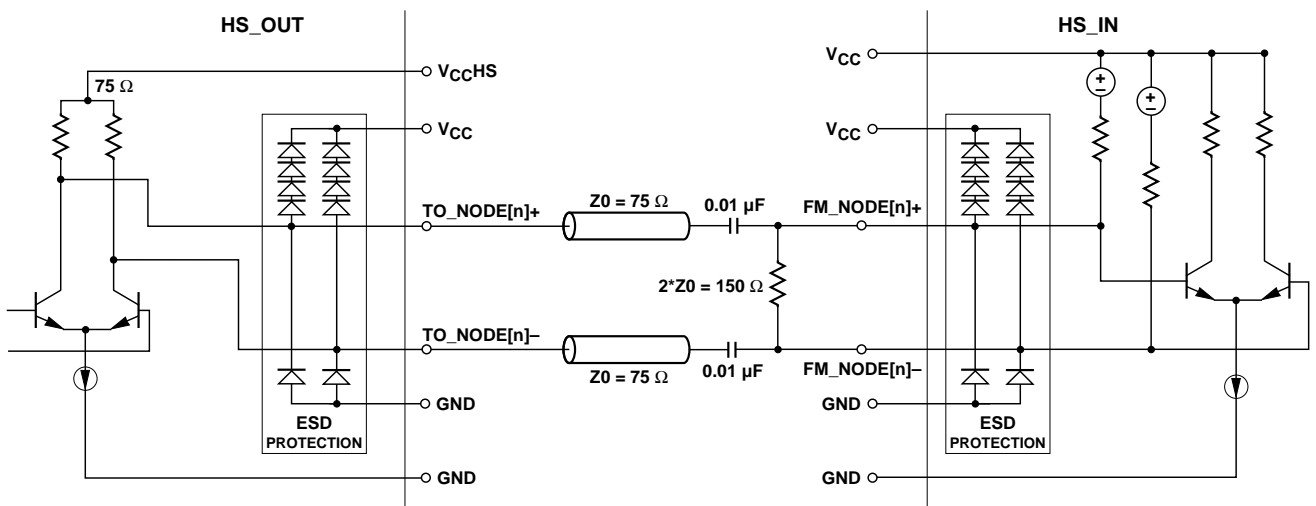

Figure 9. O-LVTTL and I-LVTTL simplified circuit schematic.

**NOTE:**

1. FM\_NODE[n] INPUTS SHOULD NEVER BE CONNECTED TO GROUND AS PERMANENT DAMAGE TO THE DEVICE MAY RESULT.

Figure 10. HS\_OUT and HS\_IN simplified circuit schematic.

## Package Information

**Power Dissipation and Thermal Resistance.**  $V_{CC} = 3.15 \text{ V to } 3.45 \text{ V}$ .

Symbol	Parameter	Units	Typ.	Max.
$P_D$	Power Dissipation	mW	460	
$\Theta_{jc}^{[1]}$	Thermal Resistance, Junction to Case	$^{\circ}\text{C/W}$	14	

### Note:

- Based on independent package testing by Agilent.  $\Theta_{ja}$  for this device is  $57^{\circ}\text{C/W}$ .  $\Theta_{ja}$  is measured on a standard 3x3" FR4 PCB in a still air environment. To determine the actual junction temperature in a given application, use the following equation:  
 $T_j = T_c + (\Theta_{ja} \times P_D)$ , where  $T_c$  is the case temperature measured on the top center of the package and  $P_D$  is the power being dissipated.

Item	Details
Package Material	Plastic Shrink Small Outline (SSOP) Per JESD Pub 95, MO-150, Var AG
Lead Finish Material	85% Tin, 15% Lead
Lead Finish Thickness	200-800 micro-inches
Lead Skew	0.15 mm max
Lead Coplanarity (Seating Plane)	0.10 mm max

## Mechanical Dimensions

DIMENSION	E1	D	E	b	e	L	c	A2	A1	A
