All characteristics are measured with a capacitor across the input of  $0.22\mu\text{F}$  and a capacitor across the output of  $0.1\mu\text{F}$ .  
All characteristics except noise voltage and ripple rejection ratios are measured using pulse techniques ( $t_p \leq 10\text{ms}$ ,  $\delta \leq 5\%$ ).  
Output voltage changes due to changes into internal temperature must be taken into account separately.

## APPLICATIONS INFORMATION

### FIXED OUTPUT REGULATOR

\* Required if the regulator is located far from the power supply filter.

\*\* Although no output capacitor is needed for stability, it does help transient response. If needed, use a 0.1µF ceramic disk.

### ADJUSTABLE OUTPUT REGULATOR

$$V_{OUT} = V_{REG} + (V_{REG} / R1 + I_Q) R2$$

$$V_{REG} / R1 > 3 I_Q$$

$$\text{Load Regulation } (L_r) \approx \left[ \frac{(R1 + R2)}{R1} \right] (L_r \text{ of regulator})$$

### CURRENT REGULATOR

$$I_{OUT} = \frac{V_{REG}}{R1} + I_Q$$

$$\Delta I_Q = 3.0mA \text{ over line and load changes.}$$
