

V850E/MS1™ 32-BIT SINGLE-CHIP MICROCONTROLLERS

The μ PD703101A-33 and μ PD703102A-33 are members of the V850 Series™ of 32-bit single-chip microcontrollers designed for real-time control operations. These microcontrollers provide on-chip features, including a 32-bit CPU core, ROM, RAM, an interrupt controller, real-time pulse unit, serial interface, A/D converter, and DMA controller.

The μ PD703100A-33 and μ PD703100A-40 are ROM less versions of the μ PD703101A-33 and μ PD703102A-33.

The μ PD703100-33, μ PD703100-40, μ PD703101-33, and μ PD703102-33 are also available as products having a 5.0 V power supply for external pins.

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

V850E/MS1 User's Manual Hardware: U12688E
V850E/MS1, V850E/MS2™ User's Manual Architecture: U12197E

FEATURES

- Number of instructions: 81
- Minimum instruction execution time: 25 ns (@ 40 MHz operation) μ PD703100A-40
30 ns (@ 33 MHz operation) μ PD703100A-33, 703101A-33, 703102A-33
- General-purpose registers: 32 bits $\times$ 32
- Instruction set optimized for control applications
- Internal memory ROM: None (μ PD703100A-33, 703100A-40), 96 KB (μ PD703101A-33), 128 KB (μ PD703102A-33)
RAM: 4 KB
- Advanced on-chip interrupt controller
- Real-time pulse unit suitable for control operations
- Powerful serial interface (on-chip dedicated baud rate generator)
- On-chip clock generator
- 10-bit resolution A/D converter: 8 channels
- DMA controller: 4 channels
- Power saving functions

APPLICATIONS

- Office automation equipment: Printers, facsimile machines, PPCs, etc.
- Multimedia equipment: Digital still cameras, video printers, etc.
- Consumer equipment: Single-lens reflex cameras, etc.
- Industrial equipment: Motor controllers, NC machine tools, etc.

The information contained in this document is being issued in advance of the production cycle for the device. The parameters for the device may change before final production or NEC Corporation, at its own discretion, may withdraw the device prior to its production.
Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

★ **Note** The product must be used under conditions that ensure the absolute maximum ratings (max. values) of each supply voltage are not exceeded.

- Cautions**
1. Do not directly connect the output (or I/O) pins to each other, or to V_{DD}, V_{CC}, and GND. Open-drain or open-collector pins, however, can be directly connected to each other. Direct connection of the output pins between an IC product and an external circuit is possible, if the output pins can be set to the high-impedance state and the output timing of the external circuit is designed to avoid output conflict.
 2. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded. The ratings and conditions shown below for DC characteristics and AC characteristics are within the range for normal operation and quality assurance.

Operating Conditions

Operation Mode	Internal Operating Clock Frequency (φ)		Operating Ambient Temperature (T _A)	Power Supply Voltage (V _{DD} , H _V DD)
Direct mode	μPD703100A-40	2 to 40 MHz	−40 to +70°C	3.0 to 3.6 V
	μPD703100A-33, 703101A-33, 703102A-33	2 to 33 MHz	−40 to +85°C	
PLL mode ^{Note 1}	μPD703100A-40	20 to 40 MHz ^{Note 2}	−40 to +70°C	
	μPD703100A-33, 703101A-33, 703102A-33	20 to 33 MHz ^{Note 3}	−40 to +85°C	

Notes 1. The internal operating clock frequency in the PLL mode is the value when operating at ×5 multiplication. Operation is also possible at a frequency of 20 MHz or lower when used at 1 or 1/2 multiplication by setting the CKDIV_n bit (n = 0, 1) of the CKC register.

2. The input clock frequency used in PLL mode should be 4.0 to 8.0 MHz.

3. The input clock frequency used in PLL mode should be used by 4.0 to 6.6 MHz.

Cautions when turning on/off the power

The μ PD703100A-33, 703100A-40, 703101A-33, and 703102A-33 are configured with power supply pins for the internal unit (V_{DD}) and for an external pin (HV_{DD}).

The operation guaranteed range is $V_{DD} = HV_{DD} = 3.0$ to 3.6 V. The input and output state of ports may be undefined when the voltage exceeds this range.

AV_{REF} input current	AI_{REF}	Note 3			2.0	mA
AV_{DD} current	AI_{DD}				5.0	mA

Notes 1. The conversion clock is the number of clocks set by the ADM1 register.

★

2. Except in IDLE/software STOP mode

★

3. The current always flows regardless of the A/D converter operating status or standby mode. To further reduce the power consumption in IDLE/software STOP mode, make the voltage of the AV_{REF} pin the same potential as V_{SS} .

5. RECOMMENDED SOLDERING CONDITIONS

This product should be soldered and mounted under the following recommended conditions.

For details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended below, contact an NEC sales representative.

Table 5-1. Surface Mounting Type Soldering Conditions

(1) μ PD703100AF1-33-FA1: 157-pin plastic FBGA (14 × 14)

μ PD703101AF1-33-xxx-FA1: 157-pin plastic FBGA (14 × 14)

μ PD703102AF1-33-xxx-FA1: 157-pin plastic FBGA (14 × 14)

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 230°C, Time: 30 seconds max. (at 210°C or higher), Count: Two times or less, Exposure limit: 3 days ^{Note} (after that, prebake at 125°C for 10 hours)	IR35-103-2
VPS	Package peak temperature: 215°C, Time: 25 to 40 seconds max. (at 200°C or higher), count: Two times or less, Exposure limit: 3 days ^{Note} (after that, prebake at 125°C for 10 hours)	VP15-103-2

Note After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

- **The information in this document is current as of June, 2002. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**
 - No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
 - NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
 - Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
 - While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
 - NEC semiconductor products are classified into the following three quality grades:
"Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.
- The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.
- (Note)
- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
 - (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
