HM5165165A Series

64M EDO DRAM (4-Mword × 16-bit)
8k refresh/4k refresh

HITACHI

ADE-203-453B (Z)
Rev. 2.0
Oct. 15, 1997

Description

The Hitachi HM5164165A Series, HM5165165A Series are CMOS dynamic RAMs organized as 4,194,304-word × 16-bit. They employ the most advanced CMOS technology for high performance and low power. HM5164165A Series, HM5165165A Series offer Extended Data Out (EDO) Page Mode as a high speed access mode. They have the package variations of standard 400 mil 50-pin plastic SOJ and standard 400 mil 50-pin plastic TSOPII

Features

- Single 3.3 V supply: 3.3 V +0.3 V/−0.15 V (HM5165165A-5R)
3.3 V ± 0.3 V (HM5164165A Series, HM5165165A/AL-6/7)
- Access time: 50 ns/60 ns/70 ns (max)
- Power dissipation
 - Active mode : TBD/450 mW/378 mW (max) (HM5164165A Series)
: 792 mW/648 mW/558 mW (max) (HM5165165A Series)
 - Standby mode : 7.2 mW (max)
: 1.08 mW (max) (L-version)
- EDO page mode capability
- Refresh cycles
 - $\overline{\text{RAS}}$ -only refresh
 - 8192 cycles /64 ms (HM5164165A)
/128 ms (HM5164165AL) (L-version)
 - 4096 cycles /64 ms (HM5165165A)
/128 ms (HM5165165AL) (L-version)
 - CBR/Hidden refresh
 - 4096 cycles /64 ms (HM5164165A, HM5165165A)
/128 ms (HM5164165AL, HM5165165AL) (L-version)
- 4 variations of refresh

HM5164165A Series, HM5165165A Series

- $\overline{\text{RAS}}$ -only refresh
- $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh
- Hidden refresh
- Self refresh (L-version)
- $\overline{2\text{CAS}}$ -byte control
- Battery backup operation (L-version)

Block Diagram (HM5165165A Series)

HM5164165A Series, HM5165165A Series

Truth Table

$\overline{RAS}$	$\overline{LCAS}$	$\overline{UCAS}$	$\overline{WE}$	$\overline{OE}$	Output		Operation
H	D	D	D	D	Open		Standby
L	L	H	H	L	Valid	Lower byte	Read cycle
L	H	L	H	L	Valid	Upper byte	
L	L	L	H	L	Valid	Word	
L	L	H	L^{*2}	D	Open	Lower byte	Early write cycle
L	H	L	L^{*2}	D	Open	Upper byte	
L	L	L	L^{*2}	D	Open	Word	
L	L	H	L^{*2}	H	Undefined	Lower byte	Delayed write cycle
L	H	L	L^{*2}	H	Undefined	Upper byte	
L	L	L	L^{*2}	H	Undefined	Word	
L	L	H	H to L	L to H	Valid	Lower byte	Read-modify-write cycle
L	H	L	H to L	L to H	Valid	Upper byte	
L	L	L	H to L	L to H	Valid	Word	
L	H	H	D	D	Open	Word	$\overline{RAS}$ -only refresh cycle
H to L	H	L	H	D	Open	Word	$\overline{CAS}$ -before- $\overline{RAS}$ refresh cycle or
H to L	L	H	H	D	Open	Word	Self refresh cycle (L-version)
H to L	L	L	H	D	Open	Word	
L	L	L	H	H	Open		Read cycle (Output disabled)

Notes: 1. H: High (inactive) L: Low (active) D: H or L

2. $t_{wCS} \geq 0$ ns Early write cycle

$t_{wCS} < 0$ ns Delayed write cycle

3. Mode is determined by the OR function of the $\overline{UCAS}$ and $\overline{LCAS}$. (Mode is set by the earliest of $\overline{UCAS}$ and $\overline{LCAS}$ active edge and reset by the latest of $\overline{UCAS}$ and $\overline{LCAS}$ inactive edge.) However write OPERATION and output HIZ control are done independently by each $\overline{UCAS}$, $\overline{LCAS}$.

ex. if $\overline{RAS} = H$ to L , $\overline{UCAS} = H$, $\overline{LCAS} = L$, then $\overline{CAS}$ -before- $\overline{RAS}$ refresh cycle is selected.

HM5164165A Series, HM5165165A Series

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Voltage on any pin relative to V_{SS}	V_T	-0.5 to $V_{CC} + 0.5$ (≤ 4.6 V (max))	V
Supply voltage relative to V_{SS}	V_{CC}	-0.5 to $+4.6$	V
Short circuit output current	I_{out}	50	mA
Power dissipation	P_T	1.0	W
Operating temperature	T_{opr}	0 to $+70$	$^{\circ}\text{C}$
Storage temperature	T_{stg}	-55 to $+125$	$^{\circ}\text{C}$

Recommended DC Operating Conditions ($T_a = 0$ to $+70^{\circ}\text{C}$)

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Supply voltage	V_{SS}	0	0	0	V	2
	V_{CC} (HM5165165A-5R)	3.15	3.3	3.6	V	1, 2
	V_{CC} (HM5164/65165A/AL-6/7)	3.0	3.3	3.6	V	1, 2
Input high voltage	V_{IH}	2.0	—	$V_{CC} + 0.3$	V	1
Input low voltage	V_{IL}	-0.3	—	0.8	V	1

Notes: 1. All voltage referred to V_{SS} .

2. The supply voltage with all V_{CC} pins must be on the same level. The supply voltage with all V_{SS} pins must be on the same level.

Parameter	Symbol	Max	Unit	Note
Refresh period	t_{REF}	64	ms	8192 cycles
Refresh period (L-version)	t_{REF}	128	ms	8192 cycles

HM5164165A Series, HM5165165A Series

Refresh (HM5165165A Series)

Parameter	Symbol	Max	Unit	Note
Refresh period	t_{REF}	64	ms	4096 cycles
Refresh period (L-version)	t_{REF}	128	ms	4096 cycles

Self Refresh Mode (L-version)

		HM5164165AL/HM5165165AL							
		-5R		-6		-7			
Parameter	Symbol	Min	Max	Min	Max	Min	Max	Unit	Notes
$\overline{RAS}$ pulse width (self refresh)	t_{RASS}	TBD	—	100	—	100	—	μs	28
$\overline{RAS}$ precharge time (self refresh)	t_{RPS}	TBD	—	110	—	130	—	ns	28
$\overline{CAS}$ hold time (self refresh)	t_{CHS}	TBD	—	-50	—	-50	—	ns	23

Notes: 1. AC measurements assume $t_T = 2$ ns.

2. An initial pause of 200 μs is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing $\overline{RAS}$ -only refresh or $\overline{CAS}$ -before- $\overline{RAS}$ refresh).
3. Operation with the t_{RCD} (max) limit insures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (max) limit, then the access time is controlled exclusively by t_{CAC} .
4. Operation with the t_{RAD} (max) limit insures that t_{RAC} (max) can be met, t_{RAD} (max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (max) limit, then access time is controlled exclusively by t_{AA} .
5. Either t_{OED} or t_{CDD} must be satisfied.
6. Either t_{DZO} or t_{DZC} must be satisfied.
7. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} (min) and V_{IL} (max).
8. Assumes that $t_{RCD} \leq t_{RCD}$ (max) and $t_{RAD} \leq t_{RAD}$ (max). If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
9. Measured with a load circuit equivalent to 1 TTL loads and 50 pF (HM5165165A-5R) and 1 TTL loads and 100 pF (HM5164165A Series, HM5165165A/AL-6/7).
10. Assumes that $t_{RCD} \geq t_{RCD}$ (max) and $t_{RCD} + t_{CAC}$ (max) $\geq t_{RAD} + t_{AA}$ (max).
11. Assumes that $t_{RAD} \geq t_{RAD}$ (max) and $t_{RCD} + t_{CAC}$ (max) $\leq t_{RAD} + t_{AA}$ (max).
12. Either t_{RCH} or t_{RRH} must be satisfied for a read cycles.
13. t_{OFF} (max), t_{OEZ} (max), t_{WEZ} (max) and t_{OFR} (max) define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
14. t_{WCS} , t_{RWD} , t_{CWD} , t_{AWD} and t_{CPW} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{WCS} \geq t_{WCS}$ (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{RWD} \geq t_{RWD}$ (min), $t_{CWD} \geq t_{CWD}$ (min), and $t_{AWD} \geq t_{AWD}$ (min), or $t_{CWD} \geq t_{CWD}$ (min), $t_{AWD} \geq t_{AWD}$ (min) and $t_{CPW} \geq t_{CPW}$ (min), the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
15. These parameters are referred to $\overline{UCAS}$ and $\overline{LCAS}$ leading edge in early write cycles and to $\overline{WE}$ leading edge in delayed write or read-modify-write cycles.

HM5164165A Series, HM5165165A Series

16. t_{RASP} defines $\overline{RAS}$ pulse width in EDO page mode cycles.
17. Access time is determined by the longest among t_{AA} , t_{CAC} and t_{CPA} .
18. When both $\overline{UCAS}$ and $\overline{LCAS}$ go low at the same time, all 16-bit data are written into the device. $\overline{UCAS}$ and $\overline{LCAS}$ cannot be staggered within the same write/read cycles.
19. All the V_{CC} and V_{SS} pins shall be supplied with the same voltages.
20. In delayed write or read-modify-write cycles, $\overline{OE}$ must disable output buffer prior to applying data to the device.
21. t_{ASC} , t_{CAH} , t_{RCS} , t_{WCS} , t_{WCH} , t_{CSR} and t_{RPC} are determined by the earlier falling edge of $\overline{UCAS}$ or $\overline{LCAS}$.
22. t_{CRP} , t_{CHR} , t_{RCH} , t_{CPA} and t_{CPW} are determined by the later rising edge of $\overline{UCAS}$ or $\overline{LCAS}$.
23. t_{CWL} , t_{DH} , t_{DS} and t_{CHS} should be satisfied by both $\overline{UCAS}$ and $\overline{LCAS}$.
24. t_{CP} is determined by the time that both $\overline{UCAS}$ and $\overline{LCAS}$ are high.
25. t_{HPC} (min) can be achieved during a series of EDO page mode write cycles or EDO page mode read cycles. If both write and read operation are mixed in a EDO page mode $\overline{RAS}$ cycle (EDO page mode mix cycle (1), (2)), minimum value of $\overline{CAS}$ cycle ($t_{CAS} + t_{CP} + 2 t_T$) becomes greater than the specified t_{HPC} (min) value. The value of $\overline{CAS}$ cycle time of mixed EDO page mode is shown in EDO page mode mix cycle (1) and (2).
26. When output buffers are enabled once, sustain the low impedance state until valid data is obtained. When output buffer is turned on and off within a very short time, generally it causes large V_{CC}/V_{SS} line noise, which causes to degrade V_{IH} min/ V_{IL} max level.
27. Data output turns off and becomes high impedance from later rising edge of $\overline{RAS}$ and $\overline{CAS}$. Hold time and turn off time are specified by the timing specifications of later rising edge of $\overline{RAS}$ and $\overline{CAS}$ between t_{OHR} and t_{OH} , and between t_{OFR} and t_{OFF} .
28. Please do not use t_{RASS} timing, $10 \mu s \leq t_{RASS} \leq 100 \mu s$. During this period, the device is in transition state from normal operation mode to self refresh mode. If $t_{RASS} \geq 100 \mu s$, then $\overline{RAS}$ precharge time should use t_{RPS} instead of t_{RP} .
29. CBR burst refresh or 4096 cycles of distributed CBR refresh with 15.6 μs interval should be executed within 64 ms immediately after exiting from and before entering into the self refresh mode.
30. Repetitive self refresh mode without refreshing all memory is not allowed. Once you exit from self refresh mode, all memory cells need to be refreshed before re-entering the self refresh mode again.
31. XXX: H or L (H: $V_{IH} \text{ (min)} \leq V_{IN} \leq V_{IH} \text{ (max)}$, L: $V_{IL} \text{ (min)} \leq V_{IN} \leq V_{IL} \text{ (max)}$)
/////: Invalid Dout
When the address, clock and input pins are not described on timing waveforms, their pins must be applied V_{IH} or V_{IL} .

Notes concerning $2\overline{\text{CAS}}$ control

Please do not separate the $\overline{\text{UCAS}}/\overline{\text{LCAS}}$ operation timing intentionally. However skew between $\overline{\text{UCAS}}/\overline{\text{LCAS}}$ are allowed under the following conditions.

1. Each of the $\overline{\text{UCAS}}/\overline{\text{LCAS}}$ should satisfy the timing specifications individually.
2. Different operation mode for upper/lower byte is not allowed; such as following.

3. Closely separated upper/lower byte control is not allowed. However when the condition ($t_{\text{CP}} \leq t_{\text{UL}}$) is satisfied, EDO page mode can be performed.

4. Byte control operation by remaining $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$ high is guaranteed.
