

VA706

HIGH-SPEED, FAST-SETTLING PRECISION OPERATIONAL AMPLIFIER

T-79-07-10

FEATURES

- Fast Settling Time: $\pm 0.1\%$ in 200ns
- High Slew Rate: $42V/\mu s$
- Wide Gain Bandwidth: 25MHz
- Ease of Use: Internally Compensated, Unity Gain Stable at $C_L = 50pF$
- Large Output Current: $\pm 50mA$
- Low Supply Voltage Operation: $\pm 4V$
- Wide Input Voltage Range: Within 1.5V of V_+ and 0.5V of V_-
- Short Circuit Protection

DESCRIPTION

The VA706 is a high-speed general purpose monolithic operational amplifier useful for signal frequencies extending into the video range. The same processing innovations which permit the high speed also allow very high output currents capable of driving large capacitive loads at high speeds.

The high open-loop voltage gain of $5000V/V$ and high slew rate of $40V/\mu s$ make the VA706 ideal for analog amplification and processing of high-speed signals.

The VA706 is internally compensated for stable operation when driving capacitive loads up to $500pF$. The wide gain bandwidth of 25MHz and $40V/\mu s$ slew rate results in $\pm 0.1\%$ settling times of 200ns, which makes the amplifier ideal for fast data conversion systems.

The high output current capability of $\pm 50mA$ allows the amplifier to drive terminated transmission lines of 50Ω with amplitudes of 5V peak to peak.

Along with the high speed and output drive capability, a $25nA$ offset current and trimmable offset voltage make the VA706 usable for signal conditioning applications where accuracy must be maintained.

ABSOLUTE MAXIMUM RATINGS

Supply Voltages	$\pm 6V$
Differential Input Voltage	$\pm 9V$
Common Mode Input Voltage	$ V_{SI} - 0.5V$
Power Dissipation (Note 1)	450mW
Output Short Circuit Current Duration (Note 2)	Indefinite
Operating Temperature Range:	

Commercial (706 J, K) 0° to $70^\circ C$
Storage Temperature Range -65° to $+150^\circ C$

Lead Temperature (Soldering to 60 Sec.) $300^\circ C$

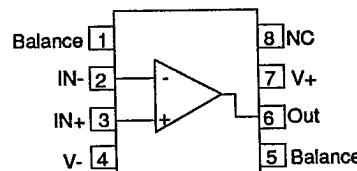

Note 1: Power derating above $T_A = 70^\circ C$ to be based on a maximum junction temperature of $150^\circ C$ and the following thermal resistance factors:

Note 2: Continuous short circuit protection is allowed to the following case and ambient temperatures:

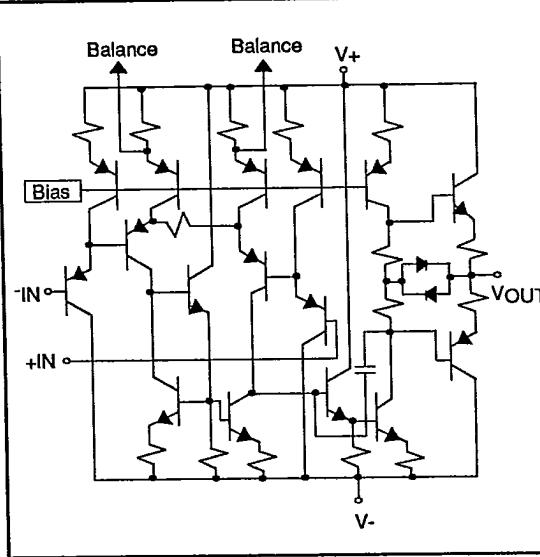

PKG.	θ_{JC} ($^\circ C/W$)	θ_{JA} ($^\circ C/W$)	T_C ($^\circ C$)	T_A ($^\circ C$)
DIP	75	180	110	70
SOIC	115	180	95	70

DICE POLICY**Electrical Characteristics**

Each die is electrically tested to the commercial or military grade DC parameters to guard band limits at 25°C to guarantee operation over the full temperature range.

Quality Assurance

All dice are 100% visually inspected to the requirement of MIL-STD-883C, Method 2010.2, Condition 3.

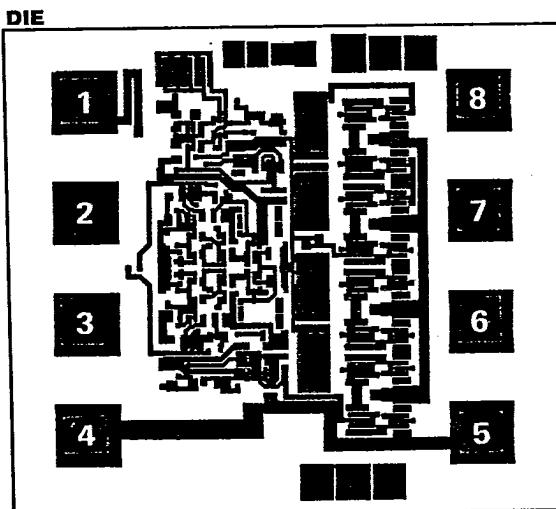

All dice are glass passivated with only the bonding pads exposed to provide scratch protection.

All dice are provided with gold backing.

Shipping Packages/Order Information

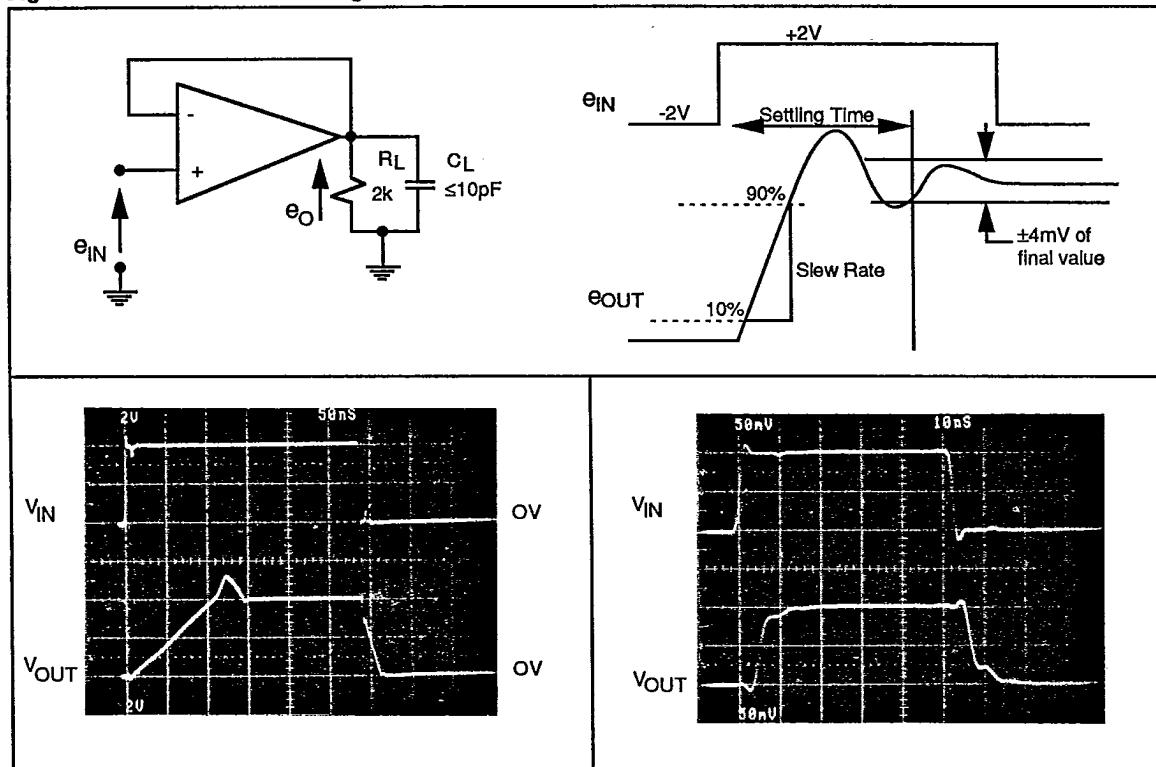

All dice are packaged in die crates with individual compartments which prevent damage to the die during shipping. The individual cavity size of the die crate is such that maximum rotation of the die within the cavity is < 45°.

Minimum order for dice is 100, supplied only in multiples of 100.

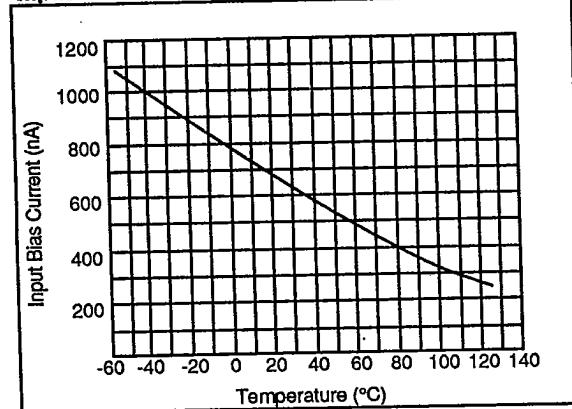

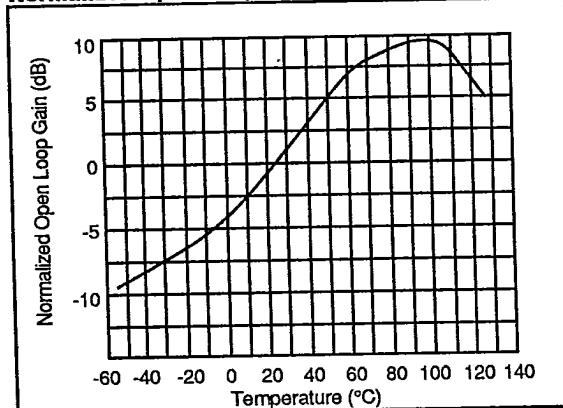

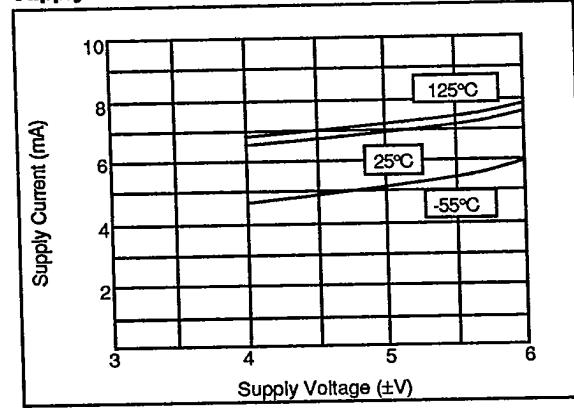

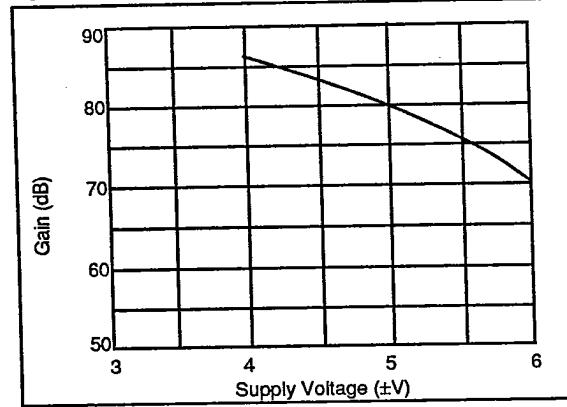

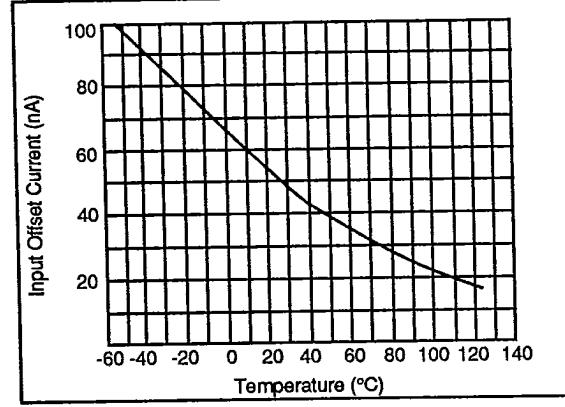

Die size = 0.035 x 0.035 inch (1225 sq. mils)
0.89 x 0.89 mm (0.79 sq. mm)
Shipped in die crates.

APPLICATION INFORMATION**AC Characteristics**

The 28MHz 0dB crossover point of the VA706 is achieved without feed-forward compensation, a technique which can produce long tails in the recovery characteristic. The single pole rolloff follows the classic 20dB/decade slope to frequencies approaching 50MHz. The phase margin of 58°, even with a capacitive load of 50pF, gives stable and predictable performance down to unity gain follower configurations.

At frequencies beyond 50MHz, the 20dB/decade slope is disturbed by an output stage zero, the damping factor of which is dependent upon the load capacitor. This results in loss of gain margin (gain at loop phase = 360°) at frequencies of 70 to 100MHz which at a gain margin of 5dB ($R_L = 2k\Omega$, $C_L = 50pF$) results in a 10dB peak in the unity gain follower closed loop characteristic (Figure 2).

Figure 2 shows a blow up of the open loop characteristics in the 10MHz to 200MHz frequency range as well as the corresponding unity gain follower characteristics at similar load conditions. It is seen that the output stage zero results in bandwidth extension beyond the 28MHz, 0dB crossover point. In fact, with the proper choice of the R_L , C_L load, the unity gain follower can be "tweaked" to give flat small signal response to 100MHz.

Figure 3 shows corresponding time domain response for a small signal step. As expected there is a strong 80MHz ring for $R_L = 2k\Omega$, $C_L = 50pF$ which disappears at $R_L = 50\Omega$, $C_L = 5pF$.

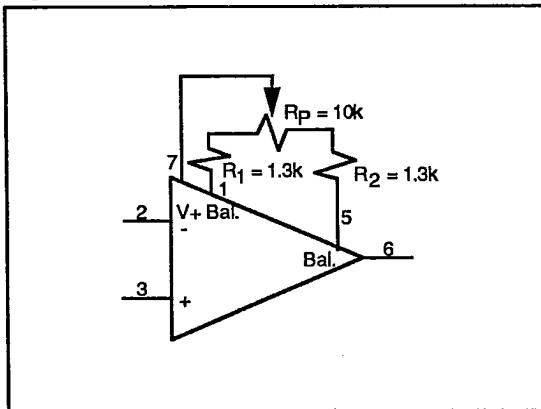

Offset Voltage Nulling

The configuration of Figure 4 will give a typical V_{OS} nulling range of $\pm 15mV$. If a smaller adjustment range is desired, resistor values $R_1 = R_2$ can be increased accordingly. For example, at $R_1 = 3.6k\Omega$, the adjustment range is $\pm 5mV$. Since pins 1 and 5 are not part of the signal path, AC characteristics are left undisturbed.

Layout Considerations

As with any high-speed wideband amplifier, certain layout considerations are necessary to ensure stable operation. All connections to the amplifier should be kept as short as possible, and the power supplies bypassed with $0.1\mu F$ capacitors to signal ground. It is suggested that a ground plane be considered as the best method for ensuring stability because it minimizes stray inductance and unwanted coupling in the ground signal paths.

To minimize capacitive effects, resistor values should be kept as small as possible, consistent with the application.
