

800mA LDO REGULATOR

NO.EA-084-0607

OUTLINE

The R1170x Series are positive voltage regulator ICs by CMOS process. The R1170x Series have features of high ripple rejection, low dropout voltage, high output voltage accuracy, low consumption current. Each of these ICs consists of a voltage reference unit, an error amplifier, resistor net for setting output voltage, a current limit circuit at short mode, a chip enable circuit, and thermal-shunt circuit. Output Voltage of R1170 is fixed in the IC.

Low consumption current by the merit of CMOS process and built-in transistors with low ON-resistance make low dropout voltage and chip enable function prolong the battery life. These regulators are remarkable improvement on the current regulators in terms of ripple rejection, input transient response, and load transient response.

Maximum Output Current is large for its compact size.

Thus, the R1170x Series are suitable for various power sources for portable appliances.

Since the packages for these ICs are the SOT-89-5 package, HSON-6, or HSOP-6J, high density mounting of the ICs on boards is possible.

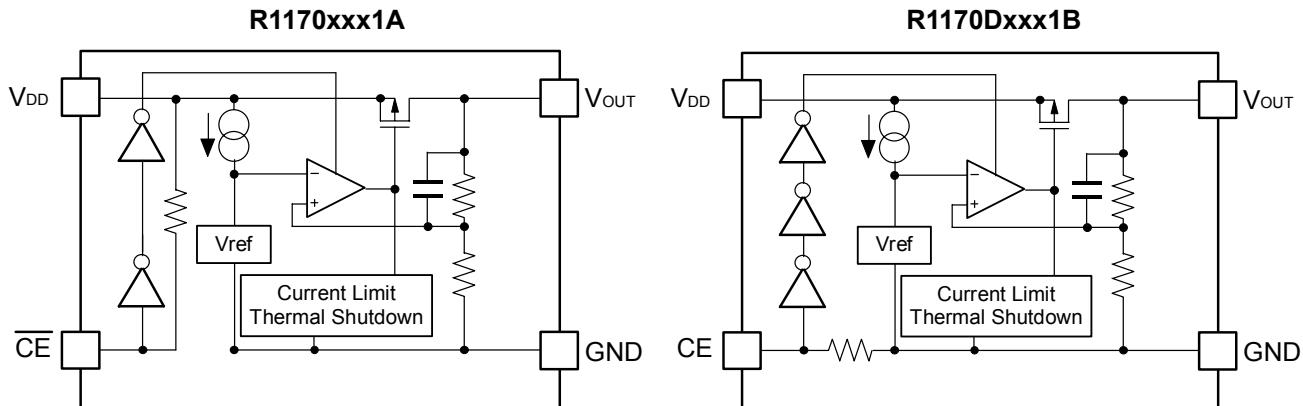

FEATURES

- Ultra-Low Supply Current..... Typ. 80 μ A
- Low Standby Current Typ. 0.1 μ A
- Output Current Min. 800mA ($V_{IN}=V_{OUT}+1.0V$)
- Low Dropout Voltage..... Typ. 0.12V ($V_{OUT}=3.0V$, $I_{OUT}=300mA$)
- High Output Voltage Accuracy $\pm 2.0\%$
- Low Temperature-drift Coefficient of Output Voltage ... Typ. $\pm 100ppm/\text{ }^{\circ}\text{C}$
- Line Regulation Typ. 0.05%/V
- Output Voltage 1.5V to 5.0V
- Small Package SOT-89-5, HSON-6, HSOP-6J
- Built-in Current Limit Circuit
- Built-in Thermal Shutdown Circuit

APPLICATIONS

- Local Power source for Notebook PC.
- Local Power source for portable appliances, cameras, and videos.
- Local Power source for equipment of battery-use.
- Local Power source for home appliances.

Technical Notes on External Components and Typical Application

Phase Compensation

In these ICs, phase compensation is made with the output capacitor for securing stable operation even if the load current is varied. For this purpose, use as much as $10\mu\text{F}$ Capacitor as C_L .

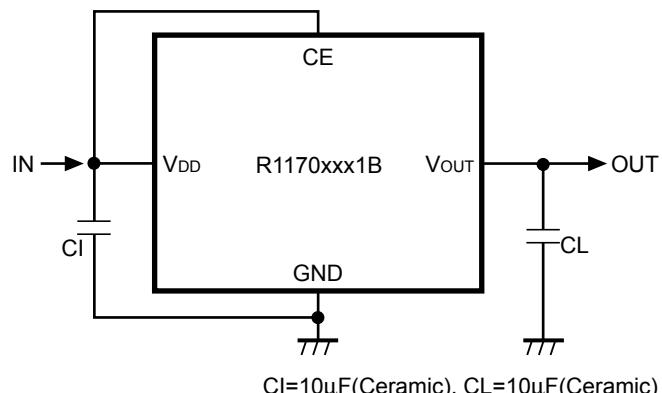

If you use a tantalum type capacitor and ESR value of the capacitor is large, output might be unstable. Evaluate your circuit with considering frequency characteristics. Further, refer to the Typical Characteristics No. 12.

Mounting on PCB

Make V_{DD} and GND lines sufficient. If their impedance is high, a current flows, the noise picked up or unstable operation may result. Further use as much as $10\mu\text{F}$ capacitor between V_{DD} pin and GND pin as close as possible.

Set an Output capacitor between V_{OUT} pin and GND pin for phase compensation as close as possible.

(Refer to the example of typical application)

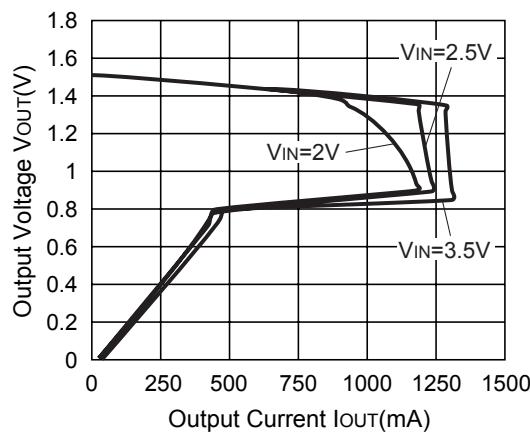

$CI=10\mu\text{F}(\text{Ceramic}), CL=10\mu\text{F}(\text{Ceramic})$

12) Stable Area (Topt=25°C, V_{IN}= Set Output Voltage+1V, C_{IN}= Ceramic 10μF)

As an output capacitor for this IC, Ceramic capacitor is recommendable. However, other low ESR type capacitor can be used with this IC.

For your reference, noise level is tested with the circuit as shown above, and if the noise level is 40μV or less than 40μV, the ESR values are plotted as stable area. Upper limit is described in the next four graphs, or ESR vs. Output Current. (Hatched area is the stable area.)
