### MH16D72AKLB-10,75

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### DESCRIPTION

The MH16D72AKLB is  $16777216 - word \times 72$ -bit Double Data Rate(DDR) Synchronous DRAM mounted module.

This consists of 9 industry standard 16M x 8 DDR Synchronous DRAMs in TSOP with SSTL\_2 interface which achieves very high speed data rate up to 133MHz.

This socket-type memory module is suitable for main memory in computer systems and easy to interchange or add modules.

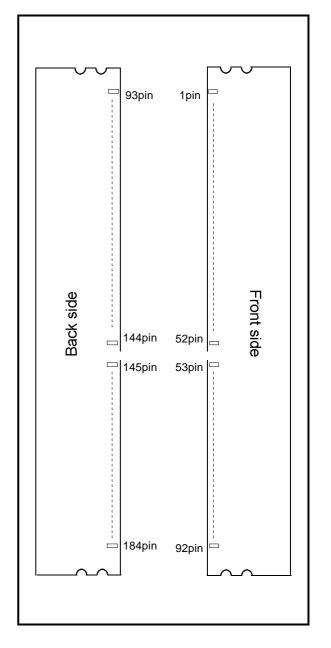

#### **FEATURES**

Type name	Max. Frequency	CLK Access Time [component level]
MH16D72AKLB-75	133MHz	± 0.75ns
MH16D72AKLB-10	100MHz	± 0.8ns

- Utilizes industry standard 16M X 8 DDR Synchronous DRAMs in TSOP package, industry standard Registered Buffer in TSSOP package, and industry standard PLL in TSSOP package.
- Vdd=Vddq=2.5v ±0.2V
- Double data rate architecture; two data transfers per clock cycle
- Bidirectional, data strobe (DQS) is transmitted/received with data
- Differential clock inputs (CK0 and /CK0)
- data and data mask referenced to both edges of DQS
- /CAS latency 2.0/2.5 (programmable)
- Burst length- 2/4/8 (programmable)
- Auto precharge / All bank precharge controlled by A10
- 4096 refresh cycles /64ms
- Auto refresh and Self refresh
- Row address A0-11 / Column address A0-9
- SSTL\_2 Interface
- Module 1bank Configration
- Burst Type sequential/interleave(programmable)
- Commands entered on each positive CLK edge

#### **APPLICATION**

Main memory unit for PC, PCserver

### **PIN FUNCTION**

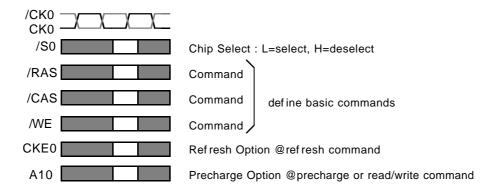

SYMBOL	TYPE	DESCRIPTION
CK0,/CK0	Input	Clock: CK0 and /CK0 are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK0 and negative edge of /CK0. Output (read) data is referenced to the crossings of CK0 and /CK0 (both directions of crossing).
CKE0	Input	Clock Enable: CKE0 controls SDRAM internal clock. When CKE0 is low, the internal clock for the following cycle is ceased. CKE0 is also used to select auto / self refresh. After self refresh mode is started, CKE0 becomes asynchronous input. Self refresh is maintained as long as CKE0 is low.
/\$0	Input	Physical Bank Select: When /S0 is high, any command means No Operation.
/RAS, /CAS, /WE	Input	Combination of /RAS, /CAS, /WE defines basic commands.
A0-11	Input	A0-11 specify the Row / Column Address in conjunction with BA0,1. The Row Address is specified by A0-11. The Column Address is specified by A0-9.  A10 is also used to indicate precharge option. When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, all banks are precharged.
BA0,1	Input	Bank Address: BA0,1 specifies one of four banks in SDRAM to which a command is applied. BA0,1 must be set with ACT, PRE, READ, WRITE commands.
DQ 0-64 CB 0-7	Input / Output	Data Input/Output: Data bus
DQS0-8	Input / Output	Data Strobe: Output with read data, input with write data. Edge-aligned with read data, centered in write data. Used to capture write data.
DM0-8	Input	Masks write data when high, issued concurrently with input data. Both DM and DQ have a write latency of one clock once the write command is registered into the SDRAM.
Vdd, Vss	Power Supply	Power Supply for the memory array and peripheral circuitry.
VddQ, VssQ	Power Supply	VddQ and VssQ are supplied to the Output Buffers only.
Vddspd	Power Supply	Power Supply for SPD
Vref	Input	SSTL_2 reference voltage.
RESET	Input	This signal is asynchronous and is driven low to the register in order to guarantee the register outputs are low.
SDA	Input / Output	This bidirectional pin is used to transfer data into or out of the SPD EEPROM.  A resistor must be connected from the SDA bus line to VDD to act as a pullup.
SCL	Input	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to VDD to act as a pullup.
SA0-2	Input	These signals are tied at the system planar to either VSS or VDD to configure the serial SPD EEPROM address range.
VDDID		VDD identification flag

### MH16D72AKLB-10,75

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### **BASIC FUNCTIONS**

The MH16D72AKLB provides basic functions, bank (row) activate, burst read / write, bank (row) precharge, and auto / self refresh. Each command is defined by control signals of /RAS, /CAS and /WE at CLK rising edge. In addition to 3 signals, /S0 ,CKE0 and A10 are used as chip select, refresh option, and precharge option, respectively. To know the detailed definition of commands, please see the command truth table.

#### Activate (ACT) [/RAS =L, /CAS =/WE =H]

ACT command activates a row in an idle bank indicated by BA.

#### Read (READ) [/RAS =H, /CAS =L, /WE =H]

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H at this command, the bank is deactivated after the burst read (auto-precharge, **READA**)

#### Write (WRITE) [/RAS =H, /CAS =/WE =L]

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is set by burst length. When A10 =H at this command, the bank is deactivated after the burst write (auto-precharge, **WRITEA**).

#### Precharge (PRE) [/RAS =L, /CAS =H, /WE =L]

MIT-DS-0397-1.4

PRE command deactivates the active bank indicated by BA. This command also terminates burst read /write operation. When A10 =H at this command, all banks are deactivated (precharge all, **PREA**).

#### Auto-Refresh (REFA) [/RAS =/CAS =L, /WE =CKE0 =H]

REFA command starts auto-refresh cycle. Refresh address including bank address are generated internally. After this command, the banks are precharged automatically.

MITSUBISHI ELECTRIC 5.Oct.2001

#### NOTE:

- 1. Applies only to read bursts with autoprecharge disabled; this command is undefined (and should not be used) for read bursts with autoprecharge enabled, and for write bursts.
- 2. BA0-BA1 select either the Base or the Extended Mode Register (BA0 = 0, BA1 = 0 selects Mode Register; BA0 = 1, BA1 = 0 selects Extended Mode Register; other combinations of BA0-BA1 are reserved; A0-A11 provide the op-code to be written to the selected Mode Register.

#### ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

BA=Bank Address, RA=Row Address, CA=Column Address, NOP=No Operation

#### NOTES:

- 1. All entries assume that CKE0 was High during the preceding clock cycle and the current clock cycle.
- 2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of that bank.
- 3. Must satisfy bus contention, bus turn around, write recovery requirements.
- 4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
- 5. ILLEGAL if any bank is not idle.

ILLEGAL = Device operation and/or data-integrity are not guaranteed.

CK0

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### **POWER ON SEQUENCE**

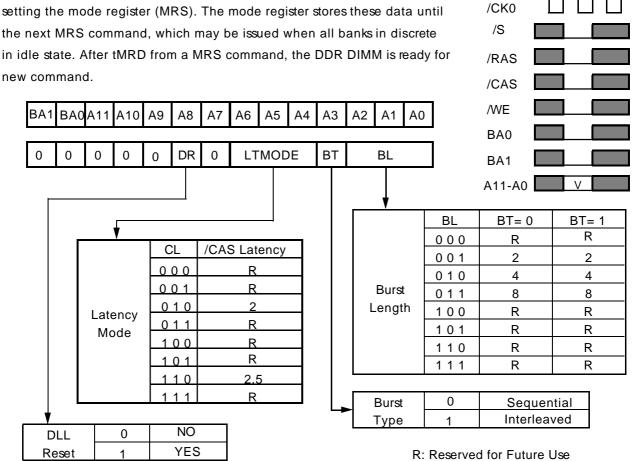

Before starting normal operation, the following power on sequence is necessary to prevent a SDRAM from damaged or multifunctioning.

- 1. Apply VDD before or the same time as VDDQ
- 2. Apply VDDQ before or at the same time as VTT & Vref
- 3. Maintain stable condition for 200us after stable power and CLK, apply NOP or DSEL
- 4. Issue precharge command for all banks of the device
- 5. Issue EMRS
- 6. Issue MRS for Mode Register and to reset the DLL
- 7. Issue 2 or more Auto Refresh commands
- 8. Maintain stable condition for 200 cycle

After these sequence, the SDRAM is idle state and ready for normal operation.

#### **MODE REGISTER**

Burst Length, Burst Type and /CAS Latency can be programmed by setting the mode register (MRS). The mode register stores these data until the next MRS command, which may be issued when all banks in discrete in idle state. After tMRD from a MRS command, the DDR DIMM is ready for

#### **EXTENDED MODE REGISTER**

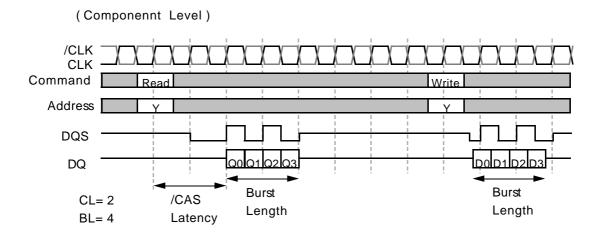

DLL disable / enable mode can be programmed by setting the extended mode register (EMRS). The extended mode register stores these data until the next EMRS command, which may be issued when all banks in discrete in idle state. After tMRD from a EMRS command, the DDR DIMM is ready for new command.

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### Notes

- 1. All voltages referenced to Vss.
- 2. Tests for AC timing, IDD, and electrical, AC and DC characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
- 3. AC timing and IDD tests may use a VIL to VIH swing of up to 1.5V in the test environment, but input timing is still referenced to VREF (or to the crossing point for CK//CK), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals is 1V/ns in the range between VIL(AC) and VIH(AC).
- 4. The AC and DC input level specifications are as defined in the SSTL\_2 Standard (i.e. the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above (below) the DC input LOW (HIGH) level.
- 5. VREF is expected to be equal to 0.5\*VddQ of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on VREF may not exceed +/-2% of the DC value.
- 6. VTT is not applied directly to the device. VTT is a system supply for signal termination resistors, is expected to be set equal to VREF, and must track variations in the DC level of VREF.
- 7. VID is the magnitude of the difference between the input level on CLK and the input level on /CLK.
- 8. The value of VIX is expected to equal 0.5\*VddQ of the transmitting device and must track variations in the DC level of the same.
- 9. Enables on-chip refresh and address counters.
- 10. IDD specification are tested after the device is properly initialized.
- 11. This parameter is sampled. VddQ = +2.5V + /-0.2V, Vdd = +2.5V + /-0.2V, f = 100MHz, Ta = 25 °C, VOUT(DC) = VddQ/2,  $VOUT(PEAK\ TO\ PEAK) = 25mV$ , DM inputs are grouped with I/O pins reflecting the fact that they are matched in laoding (to faciliate trace matching at the board level).
- 12. The CLK//CLK input reference level (for signals other than CLK//CLK) is the point at which CLK and /CLK cross; the input reference level for signals other than CLK//CLK, is VREF.
- 13. Inputs are not recognized as valid until VREF stabilized. Exception: during the period before VREF stabilizes, CKE=< 0.3VddQ is recognized as LOW.
- 14. t HZ and tLZ transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ), or begins driving (LZ).
- 15. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
- 16. The specific requirement is that DQS be valid (HIGH, LOW, or at some point on a valid transition) on or before this CLK edge. A valid transition is defined as monotonic, and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from High-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on tDQSS.
- 17. A maximum of eight AUTO REFRESH commands can be posted to any given DDR SDRAM device.
- 18. tXPRD should be 200 tCLK in the condition of the unstable CLK operation during the power down mode.
- 19. For command/address and CLK & /CLK slew rate ≥1.0V/ns.

MIT-DS-0397-1.4

20. Min(tCL, tCH)refers to the smaller of the actual clock low time and the actualclock high time as provided to the device.

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

MIT-DS-0397-1.4

MITSUBISHI ELECTRIC

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### OPERATIONAL DESCRIPTION

#### **BANK ACTIVATE**

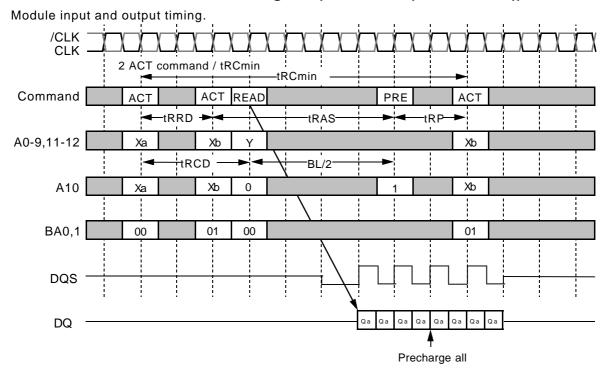

The DDR SDRAM has four independent banks. Each bank is activated by the ACT command with the bank addresses (BA0,1). A row is indicated by the row address A11-0. The minimum activation interval between one bank and the other bank is tRRD. Maximum 2 ACT commands are allowed within tRC, although the number of banks which are active concurrently is not limited.

#### **PRECHARGE**

MIT-DS-0397-1.4

The PRE command deactivates the bank indicated by BA0,1. When multiple banks are active, the precharge all command (PREA,PRE+A10=H) is available to deactivate them at the same time. After tRP from the precharge, an ACT command to the same bank can be issued.

#### Bank Activation and Precharge All (BL=8, CL=2 (Discrete level))

A precharge command can be issued at BL/2(Discrete) from a read command without data loss.

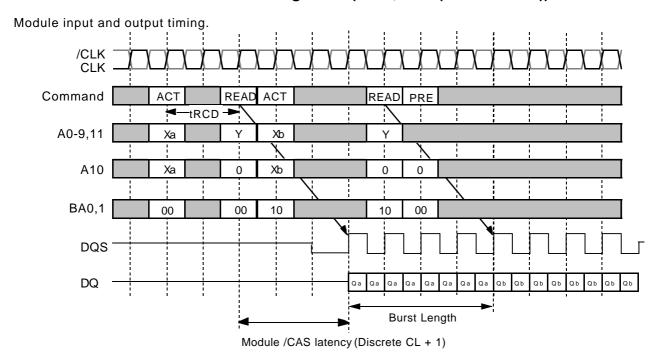

22

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### **READ**

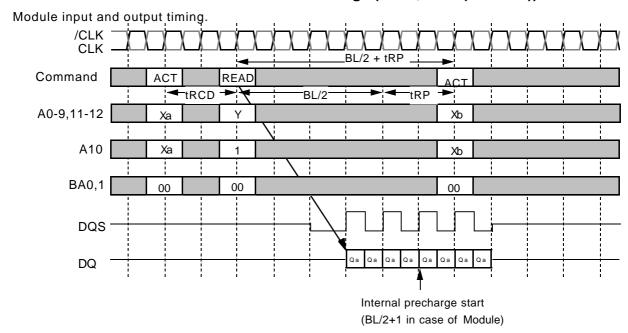

After tRCD from the bank activation, a READ command can be issued. 1st Output data is available after the /CAS Latency from the READ, followed by (BL-1) consecutive data when the Burst Length is BL. The start address is specified by A11,A9-A0, and the address sequence of burst data is defined by the Burst Type. A READ command may be applied to any active bank, so the row precharge time (tRP) can be hidden behind continuous output data by interleaving the multiple banks. When A10 is high at a READ command, the auto-precharge(READA) is performed. Any command(READ,WRITE,PRE,ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at BL/2 after READA. The next ACT command can be issued after (BL/2+tRP) from the previous READA.

#### Multi Bank Interleaving READ (BL=8, CL=2(Discrete level))

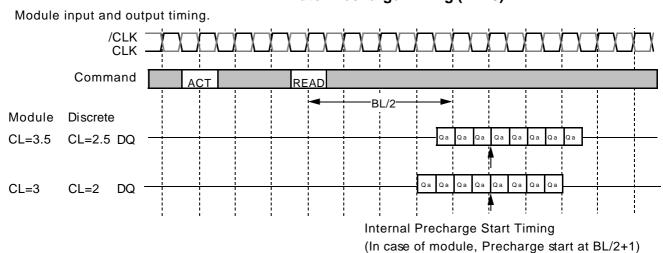

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### READ with Auto-Precharge (BL=8, CL=2(Discrete))

#### **READ Auto-Precharge Timing (BL=8)**

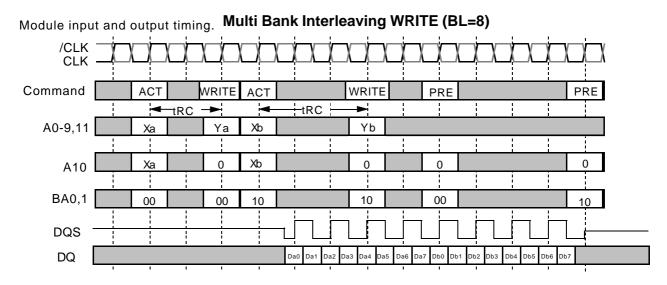

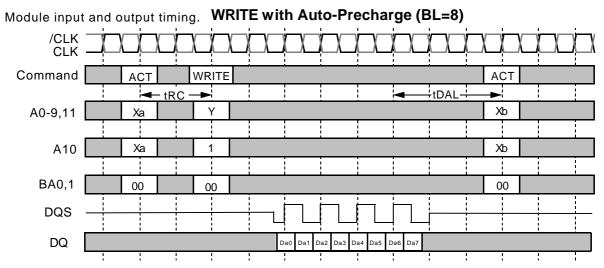

### MH16D72AKLB-10,75

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### **WRITE**

After tRCD from the bank activation, a WRITE command can be issued. 1st input data is set from the WRITE command with data strobe input, following (BL-1) data are written into RAM, when the Burst Length is BL. The start address is specified by A11,A9-A0, and the address sequence of burst data is defined by the Burst Type. A WRITE command may be applied to any active bank, so the row precharge time (tRP) can be hidden behind continuous input data by interleaving the multiple banks. From the last data to the PRE command, the write recovery time (tWRP) is required. When A10 is high at a WRITE command, the auto-precharge(WRITEA) is performed. Any command(READ,WRITE,PRE,ACT) to the same bank is inhibited till the internal precharge is complete. The next ACT command can be issued after tDAL from the last input data cycle.

# BURST INTERRUPTION [Read Interrupted by Read]

Burst read operation can be interrupted by new read of any bank. Random column access is allowed. READ to READ interval is minimum 1CLK.

#### [Read Interrupted by precharge]

Burst read operation can be interrupted by precharge of the same bank. READ to PRE interval is minimum 1 CLK. A PRE command to output disable latency is equivalent to the /CAS Latency. As a result, READ to PRE interval determines valid data length to be output. The figure below shows examples of BL=8.

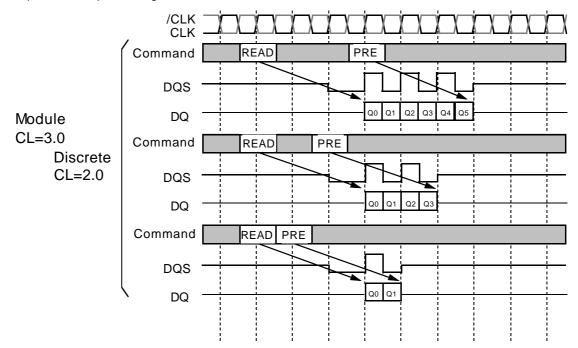

MIT-DS-0397-1.4 5.Oct.2001

### Read Interrupted by Precharge (BL=8)

Module input and output timing.

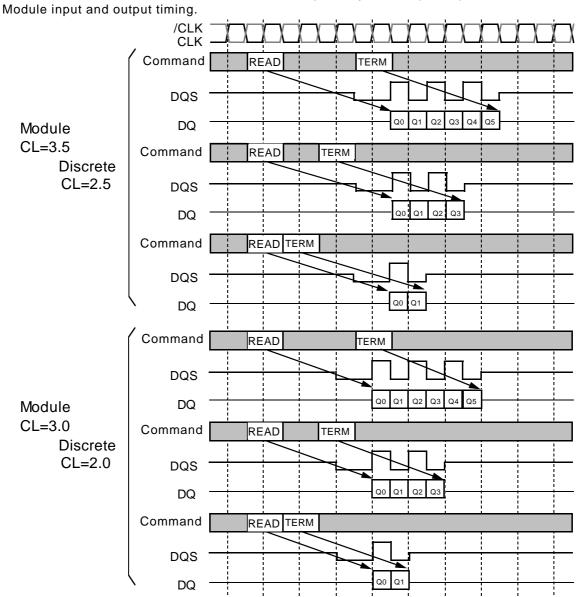

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### [Read Interrupted by Burst Stop]

Burst read operation can be interrupted by a burst stop command(TERM). READ to TERM interval is minimum 1 CLK. A TERM command to output disable latency is equivalent to the /CAS Latency. As a result, READ to TERM interval determines valid data length to be output. The figure below shows examples of BL=8.

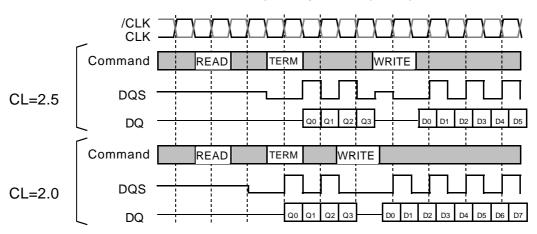

### Read Interrupted by TERM (BL=8)

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### [Read Interrupted by Write with TERM]

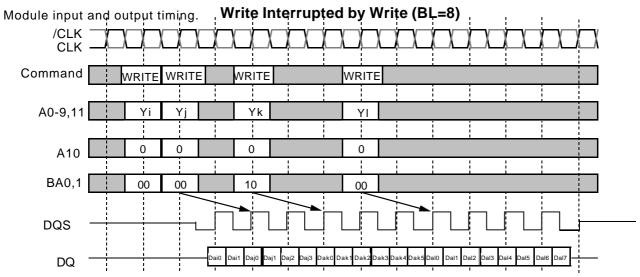

#### Read Interrupted by TERM (BL=8)

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

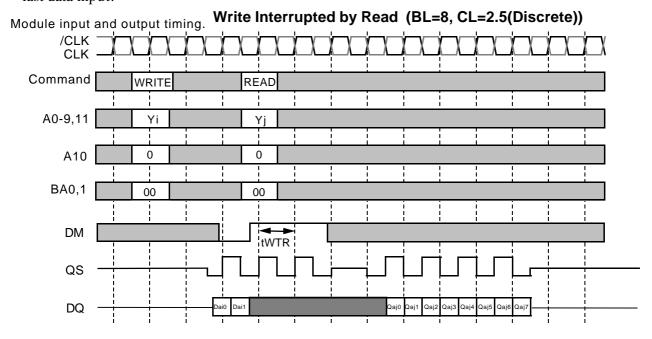

#### [Write interrupted by Write]

Burst write operation can be interrupted by write of any bank. Random column access is allowed. WRITE to WRITE interval is minimum 1 CLK.

#### [Write interrupted by Read]

Burst write operation can be interrupted by read of the same or the other bank. Random column access is allowed. Internal WRITE to READ command interval(tWTR) is minimum 1 CLK. The input data on DQ at the interrupting READ cycle is "don't care". tWTR is referenced from the first positive edge after the last data input.

MIT-DS-0397-1.4

MITSUBISHI ELECTRIC

### MH16D72AKLB-10,75

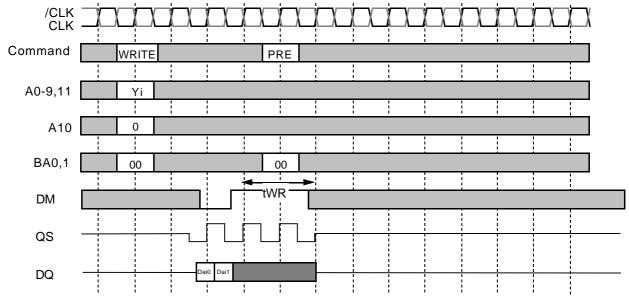

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### [Write interrupted by Precharge]

Burst write operation can be interrupted by precharge of the same or all bank. Random column access is allowed. tWR is referenced from the first positive CLK edge after the last data input.

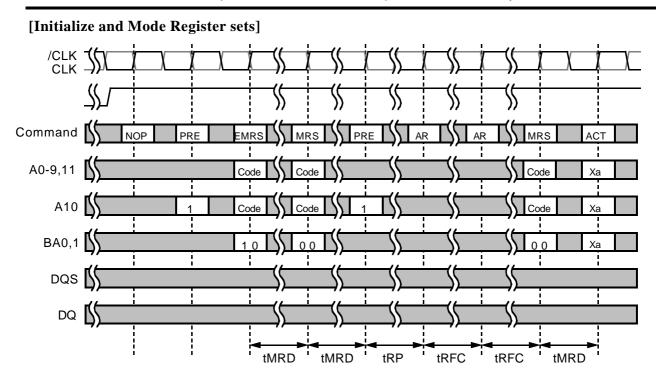

#### Write Interrupted by Precharge (BL=8, CL=2.5)

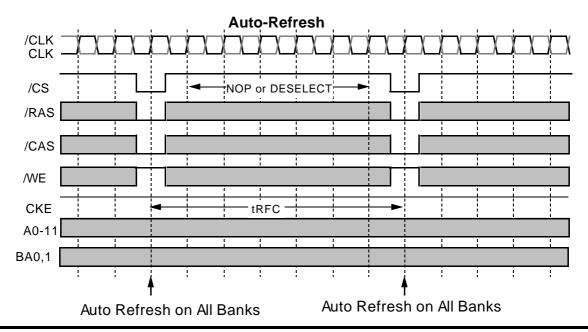

### MH16D72AKLB-10,75

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### [AUTO REFRESH]

Single cycle of auto-refresh is initiated with a REFA(/CS=/RAS=/CAS=L,/WE=CKE=H) command. The refresh address is generated internally. 4096 REFA cycles within 64ms refresh 128M bits memory cells. The auto-refresh is performed on 4 banks concurrently. Before performing an auto refresh, all banks must be in the idle state. Auto-refresh to auto-refresh interval is minimum tRFC. Any command must not be supplied to the device before tRFC from the REFA command.

MIT-DS-0397-1.4

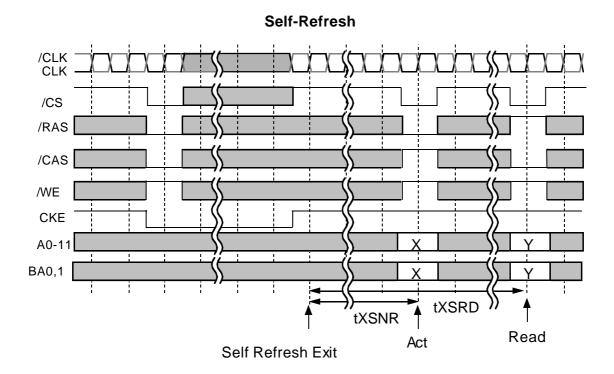

MITSUBISHI ELECTRIC

### MH16D72AKLB-10,75

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### [SELF REFRESH]

Self-refresh mode is entered by issuing a REFS command (/CS=/RAS=/CAS=L,/WE=H,CKE=L). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enable input, all other inputs including CLK are disabled and ignored, so that power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CLK inputs, asserting DESEL or NOP command and then asserting CKE for longer than tXSNR/tXSRD.

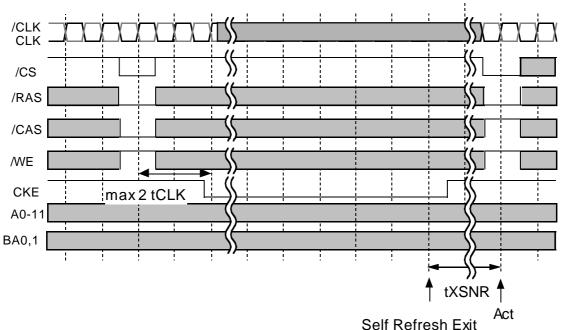

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### [Asynchronous SELF REFRESH]

Asynchronous Self -refresh mode is entered by CKE=L within 2 tCLK after issuing a REFA command (/CS=/RAS=/CAS=L,/WE=H). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enable input, all other inputs including CLK are disabled and ignored, so that power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CLK inputs, asserting DESEL or NOP command and then asserting CKE for longer than tXSNR/tXSRD.

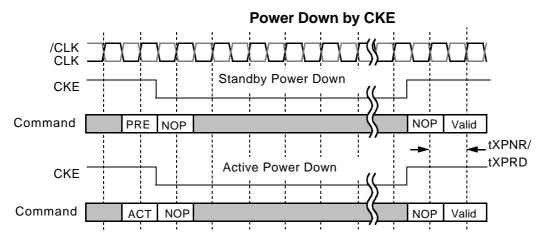

# Asynchronous Self-Refresh

1,207.959,552-BIT (16,777,216-WORD BY 72-BIT) Double Data Rate Synchronous DRAM Module

#### [Power DOWN]

The purpose of CLK suspend is power down. CKE is synchronous input except during the self-refresh mode. A command at cycle is ignored. From CKE=H to normal function, DLL recovery time is NOT required in the condition of the stable CLK operation during the power down mode.

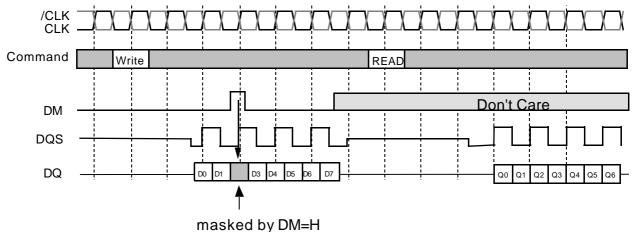

#### [DM CONTROL]

DM is defined as the data mask for writes. During writes, DM masks input data word by word. DM to write mask latency is 0.

#### DM Function(BL=8,CL=2(Discrete))

### "Keep safety first in your circuit designs!"

Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

### Notes regarding these materials

- 1. These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- 2.Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- 3.All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein. The information described here may contain technical inaccuracies or typographical errors. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.

Please also pay attention to information published by Mitsubishi Electric Corporation by various means, including the Mitsubishi Semiconductor home page (http://www.mitsubishichips.com).

- 4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- 5. Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- 6. The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- 7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
- Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- 8.Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
