## 9-channel IEEE 1284 filter/termination with 2 kV ESD protection

## IP4100 series

### FEATURES

- 9-channel RC filter array with pull-up resistors
- ESD protection: >2 kV
- Undershoot protection
- High capacitance range
- Available in 20-pin or 24-pin QSOP and 20-pin SOIC packages.

### APPLICATIONS

IEEE 1284 filter/termination for:

- Workstations
- Desktop and portable computers
- PDAs
- PCMICA cards.

### DESCRIPTION

The Philips IP4100 series of Application Specific Integrated Products (ASIPs) is a 9-channel solution for termination and filtering for high speed IEEE 1284 parallel interfaces while also providing ESD protection of >2 kV. IP4100 devices are fabricated using thin film-on-silicon technology and integrates 18 resistors, 9 capacitors and 18 diodes in various package configurations.

The IP4100 is configured as low pass filters with high impedance pull-ups. As filters, the IP4100 will pass low frequency digital data and attenuate undesired high frequency signals. As terminations, the IP4100 will reduce reflections caused by transmission line effects of long cable lines.

The integral diodes of the IP4100 provide ESD protection of <2 kV. Furthermore, the diodes help maintain signal integrity on digital transmission lines by reducing logic undershoot conditions.

### QUALITY AND RELIABILITY

#### Wafer fabrication and packaging technology

Philips ASIPs use well-proven semiconductor industry thin film-on-silicon fabrication and packaging technologies. Wafers are processed in a clean room wafer fabrication environment with circuit elements defined using a photolithography process. Metal disposition is performed by precision sputter process. Finished wafers are diced, assembled and tested in a state-of-the-art assembly and packaging facility fully compliant with ISO 9002.

#### Tests and requirements

The following tests have been conducted on representative samples of Philips ASIPs in QSOP (SSOP), SOIC and similar industry standard plastic packages in accordance with the appropriate IEC, EIA and EIAJ requirements.

**Table 7** Test procedures and requirements

EIA/JESD22 TEST METHOD	TEST	PROCEDURE	REQUIREMENTS
B102-A	solderability (after ageing)	8 hours steam; immersed for 5 s in a solder bath at 215 °C	good tinning ( $\geq 95\%$ covered); no visible damage
A113-A	SMD sequential stress	preconditioning; 5 cycles: $-55$ to $+125$ °C; 24 hours bake; temperature and humidity soak; 3 cycles of IR convection reflow at maximum 220 °C	device functional; no visible damage; SAT inspection
A104-A	temperature cycling	1000 cycles: 10 minutes minimum at $-65$ °C 10 minutes minimum at $+150$ °C	no visible damage; $\Delta R/R$ max.: $\pm 1\%$ ; $\Delta C/C$ max.: $\pm 1\%$
A102-B	autoclave (pressure pot)	336 hours: 121 °C, 100% RH	no visible damage; $\Delta R/R$ max.: $\pm 1\%$ ; $\Delta C/C$ max.: $\pm 1\%$
