

MOTOROLA

# High Performance Dual Channel Current Mode Controllers

The MC34065-H,L series are high performance, fixed frequency, dual current mode controllers. They are specifically designed for off-line and dc-to-dc converter applications offering the designer a cost effective solution with minimal external components. These integrated circuits feature a unique oscillator for precise duty cycle limit and frequency control, a temperature compensated reference, two high gain error amplifiers, two current sensing comparators, Drive Output 2 Enable pin, and two high current totem pole outputs ideally suited for driving power MOSFETs.

Also included are protective features consisting of input and reference undervoltage lockouts each with hysteresis, cycle-by-cycle current limiting, and a latch for single pulse metering of each output. These devices are available in dual-in-line and surface mount packages.

The MC34065-H has UVLO thresholds of 14 V (on) and 10 V (off), ideally suited for off-line converters. The MC34065-L is tailored for lower voltage applications having UVLO thresholds of 8.4 V (on) and 7.8 V (off).

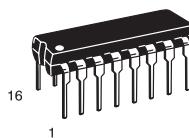

- Unique Oscillator for Precise Duty Cycle Limit and Frequency Control
- Current Mode Operation to 500 kHz
- Automatic Feed Forward Compensation
- Separate Latching PWMs for Cycle-By-Cycle Current Limiting
- Internally Trimmed Reference with Undervoltage Lockout
- Drive Output 2 Enable Pin
- Two High Current Totem Pole Outputs
- Input Undervoltage Lockout with Hysteresis
- Low Startup and Operating Current

## OPERATING DESCRIPTION

The MC34065-H,L series are high performance, fixed frequency, dual channel current mode controllers specifically designed for Off-Line and dc-to-dc converter applications. These devices offer the designer a cost effective solution with minimal external components where independent regulation of two power converters is required. The Representative Block Diagram is shown in Figure 15. Each channel contains a high gain error amplifier, current sensing comparator, pulse width modulator latch, and totem pole output driver. The oscillator, reference regulator, and undervoltage lock-out circuits are common to both channels.

### Oscillator

The unique oscillator configuration employed features precise frequency and duty cycle control. The frequency is programmed by the values selected for the timing components  $R_T$  and  $C_T$ . Capacitor  $C_T$  is charged and discharged by an equal magnitude internal current source and sink, generating a symmetrical 50 percent duty cycle waveform at Pin 2. The oscillator peak and valley thresholds are 3.5 V and 1.6 V respectively. The source/sink current magnitude is controlled by resistor  $R_T$ . For proper operation over temperature it must be in the range of 4.0 k $\Omega$  to 16 k $\Omega$  as shown in Figure 1.

As  $C_T$  charges and discharges, an internal blanking pulse is generated that alternately drives the center inputs of the upper and lower NOR gates high. This, in conjunction with a precise amount of delay time introduced into each channel, produces well defined non-overlapping output duty cycles. Output 2 is enabled while  $C_T$  is charging, and Output 1 is enabled during the discharge. Figure 2 shows the Maximum Output Duty Cycle versus Oscillator Frequency. Note that even at 500 kHz, each output is capable of approximately 44% on-time, making this controller suitable for high frequency power conversion applications.

In many noise sensitive applications it may be desirable to frequency-lock the converter to an external system clock. This can be accomplished by applying a clock signal as shown in Figure 17. For reliable locking, the free-running oscillator frequency should be set about 10% less than the clock frequency. Referring to the timing diagram shown in Figure 16, the rising edge of the clock signal applied to the Sync input, terminates charging of  $C_T$  and Drive Output 2 conduction. By tailoring the clock waveform symmetry, accurate duty cycle clamping of either output can be achieved. A circuit method for this, and multi-unit synchronization, is shown in Figure 18.

### Error Amplifier

Each channel contains a fully-compensated Error Amplifier with access to the inverting input and output. The amplifier features a typical dc voltage gain of 100 dB, and a unity gain bandwidth of 1.0 MHz with 71° of phase margin (Figure 5). The noninverting input is internally biased at 2.5 V and is not pinned out. The converter output voltage is typically divided down and monitored by the inverting input through a resistor divider. The maximum input bias current is  $-1.0 \mu\text{A}$  which will cause an output voltage error that is equal to the product of the input bias current and the equivalent input divider source resistance.

The Error Amp output (Pin 5, 12) is provided for external loop compensation. The output voltage is offset by two diode

drops ( $\approx 1.4$  V) and divided by three before it connects to the inverting input of the Current Sense Comparator. This guarantees that no pulses appear at the Drive Output (Pin 7, 10) when the error amplifier output is at its lowest state ( $V_{OL}$ ). This occurs when the power supply is operating and the load is removed, or at the beginning of a soft-start interval (Figures 20, 21).

The minimum allowable Error Amp feedback resistance is limited by the amplifier's source current (0.5 mA) and the output voltage ( $V_{OH}$ ) required to reach the comparator's 1.0 V clamp level with the inverting input at ground. This condition happens during initial system startup or when the sensed output is shorted:

$$R_f(\min) \approx \frac{3.0 \text{ (1.0 V)} + 1.4 \text{ V}}{0.5 \text{ mA}} = 8800 \Omega$$

### Current Sense Comparator and PWM Latch

The MC34065 operates as a current mode controller, whereby output switch conduction is initiated by the oscillator and terminated when the peak inductor current reaches the threshold level established by the Error Amplifier output. Thus the error signal controls the peak inductor current on a cycle-by-cycle basis. The Current Sense Comparator-PWM Latch configuration used ensures that only a single pulse appears at the Drive Output during any given oscillator cycle. The inductor current is converted to a voltage by inserting a ground-referenced sense resistor  $R_S$  in series with the source of output switch Q1. This voltage is monitored by the Current Sense Input (Pin 6, 11) and compared to a level derived from the Error Amp output. The peak inductor current under normal operating conditions is controlled by the voltage at Pin 5, 12 where:

$$I_{pk} = \frac{V(\text{Pin 5, 12}) - 1.4 \text{ V}}{3 R_S}$$

Abnormal operating conditions occur when the power supply output is overloaded or if output voltage sensing is lost. Under these conditions, the Current Sense Comparator threshold will be internally clamped to 1.0 V. Therefore the maximum peak switch current is:

$$I_{pk(\max)} = \frac{1.0 \text{ V}}{R_S}$$

When designing a high power switching regulator it may be desirable to reduce the internal clamp voltage in order to keep the power dissipation of  $R_S$  to a reasonable level. A simple method to adjust this voltage is shown in Figure 19. The two external diodes are used to compensate the internal diodes, yielding a constant clamp voltage over temperature. Erratic operation due to noise pickup can result if there is an excessive reduction of the  $I_{pk(\max)}$  clamp voltage.

A narrow spike on the leading edge of the current waveform can usually be observed and may cause the power supply to exhibit an instability when the output is lightly loaded. This spike is due to the power transformer interwinding capacitance and output rectifier recovery time. The addition of an RC filter on the Current Sense input with a time constant that approximates the spike duration will usually eliminate the instability, refer to Figure 24.

## Undervoltage Lockout

Two Undervoltage Lockout comparators have been incorporated to guarantee that the IC is fully functional before the output stages are enabled. The positive power supply terminal ( $V_{CC}$ ) and the reference output ( $V_{ref}$ ) are each monitored by separate comparators. Each has built-in hysteresis to prevent erratic output behavior as their respective thresholds are crossed. The  $V_{CC}$  comparator upper and lower thresholds are 14 V/10 V for  $-H$  suffix, and 8.4 V/7.6 V for  $-L$  suffix. The  $V_{ref}$  comparator upper and lower thresholds are 3.6 V/3.4 V respectively. The large hysteresis and low startup current of the  $-H$  suffix version makes it ideally suited in off-line converter applications where efficient bootstrap startup techniques are required (Figure 28). The  $-L$  suffix version is intended for lower voltage dc-to-dc converter applications. The minimum operating voltage for the  $-H$  suffix is 11 V and 8.2 V for the  $-L$  suffix.

## Drive Outputs and Drive Ground

Each section contains a single totem-pole output stage that is specifically designed for direct drive of power MOSFETs. The Drive Outputs are capable of up to  $\pm 400$  mA peak current with a typical rise and fall time of 50 ns with a 1.0 nF load. Additional internal circuitry has been added to keep the outputs in a sinking mode whenever an Undervoltage Lockout is active. This characteristic eliminates the need for an external pull-down resistor. The totem-pole output has been optimized to minimize cross-conduction current in high speed operation. The addition of two 10  $\Omega$  resistors, one in series with the source output transistor and one in series with the sink output transistor, reduces the cross-conduction current to minimal levels, as shown in Figure 13.

Although the Drive Outputs were optimized for MOSFETs, they can easily supply the negative base current required by bipolar NPN transistors for enhanced turn-off (Figure 25).

**Figure 15. Representative Block Diagram**

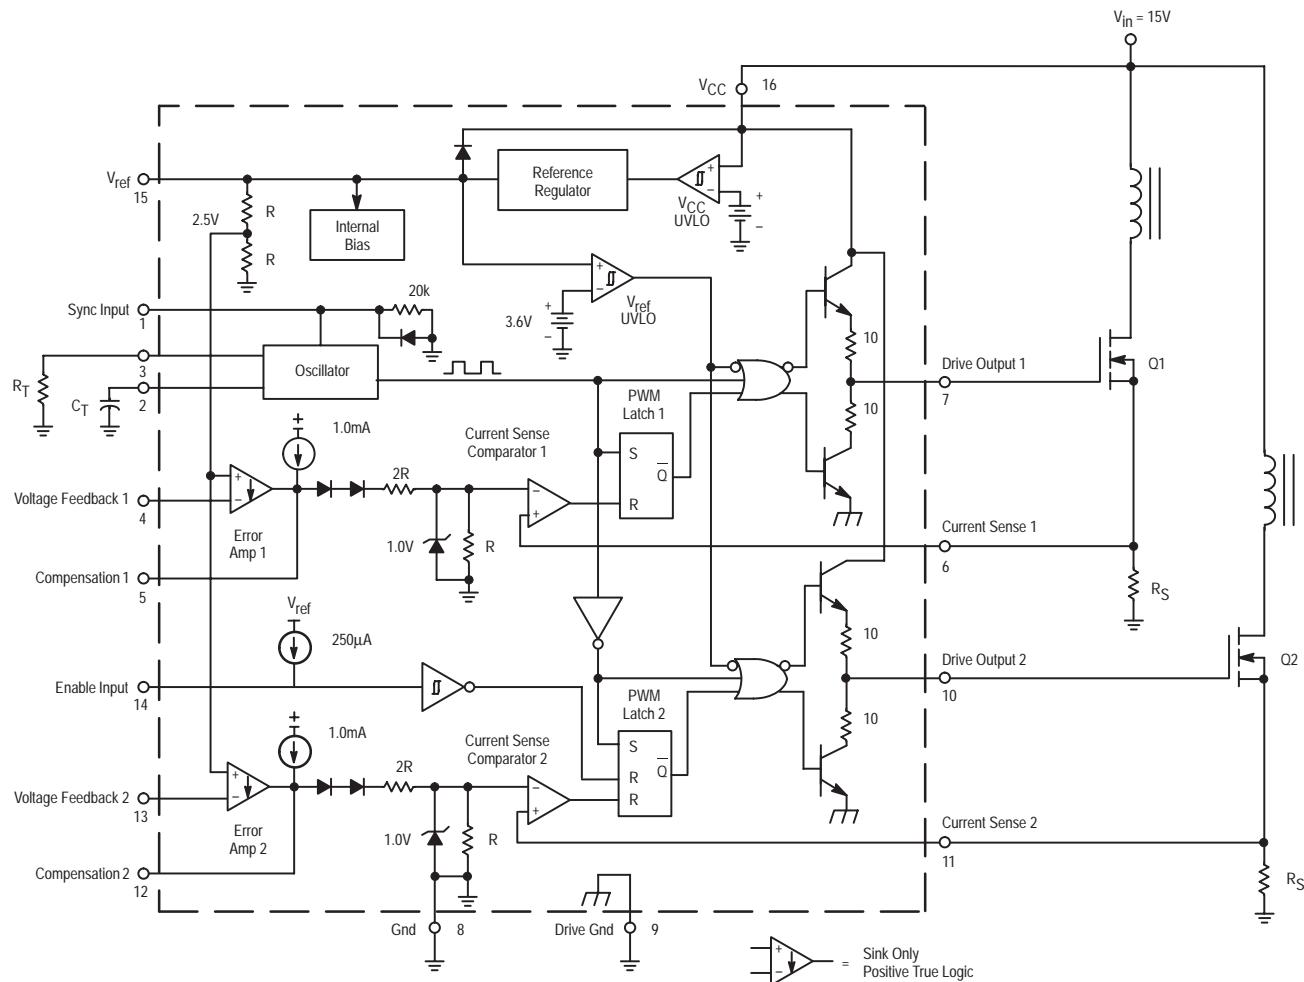

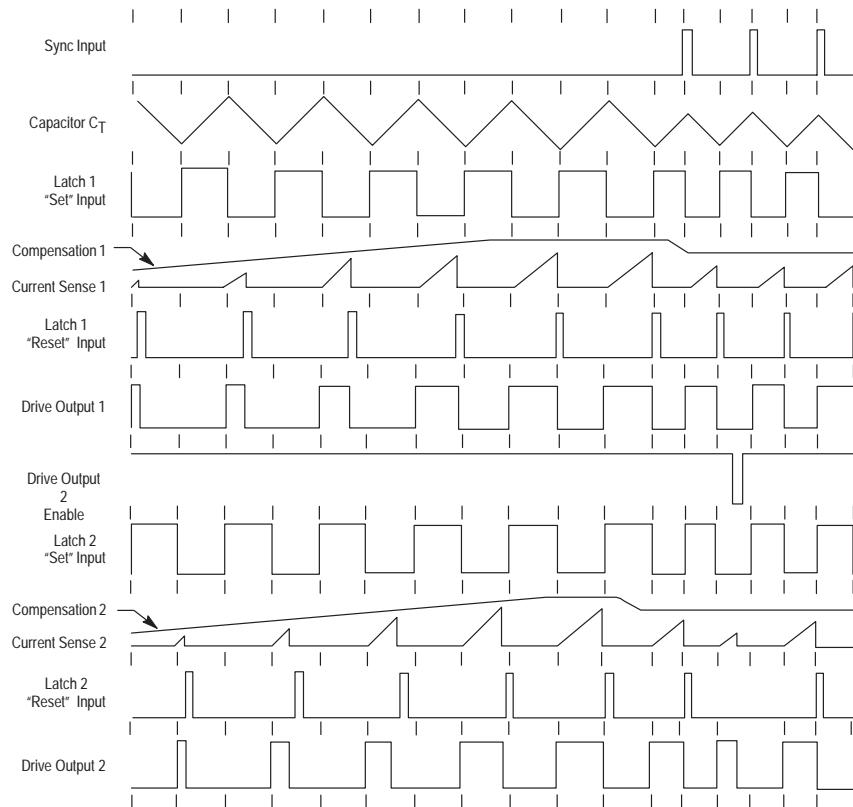

Figure 16. Timing Diagram

The outputs do not contain internal current limiting, therefore an external series resistor may be required to prevent the peak output current from exceeding the  $\pm 400$  mA maximum rating. The sink saturation ( $V_{OL}$ ) is less than 0.75 V at 50 mA.

A separate Drive Ground pin is provided and, with proper implementation, will significantly reduce the level of switching transient noise imposed on the control circuitry. This becomes particularly useful when reducing the  $I_{pk(max)}$  clamp level. Figure 23 shows the proper ground connections required for current sensing power MOSFET applications.

#### Drive Output 2 Enable Pin

This input is used to enable Drive Output 2. Drive Output 1 can be used to control circuitry that must run continuously such as volatile memory and the system clock, or a remote controlled receiver, while Drive Output 2 controls the high power circuitry that is occasionally turned off.

#### Reference

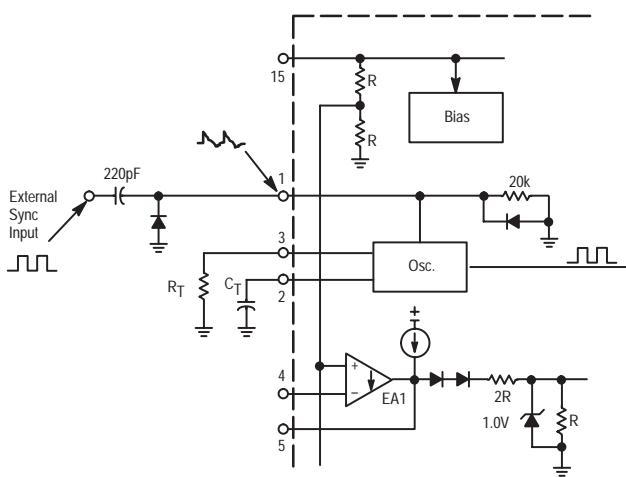

The 5.0 V bandgap reference is trimmed to  $\pm 2.0\%$  tolerance at  $T_J = 25^\circ\text{C}$ . The reference has short circuit protection and is capable of providing in excess of 30 mA for powering any additional control system circuitry.

#### Design Considerations

**Do not attempt to construct the converter on wire-wrap or plug-in prototype boards.** High frequency circuit layout techniques are imperative to prevent pulse-width jitter. This is usually caused by excessive noise pick-up imposed on the Current Sense or Voltage Feedback inputs. Noise immunity can be improved by lowering circuit impedances at these points. The printed circuit layout should contain a ground plane with low current signal and high current switch and output grounds returning on separate paths back to the input filter capacitor. Ceramic bypass capacitors ( $0.1 \mu\text{F}$ ) connected directly to  $V_{CC}$  and  $V_{ref}$  may be required depending upon circuit layout. This provides a low impedance path for filtering the high frequency noise. All high current loops should be kept as short as possible using heavy copper runs to minimize radiated EMI. The Error Amp compensation circuitry and the converter output voltage-divider should be located close to the IC and as far as possible from the power switch and other noise generating components.

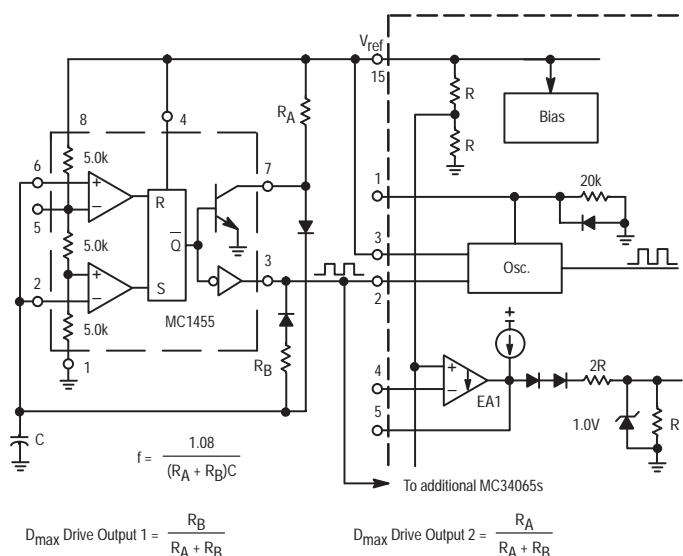

# MC34065-H, L MC33065-H, L

**Figure 17. External Clock Synchronization**

The external diode clamp is required if the negative Sync current is greater than -5.0 mA.

**Figure 18. External Duty Cycle Clamp and Multi-Unit Synchronization**

$$D_{\max} \text{ Drive Output } 1 = \frac{R_B}{R_A + R_B}$$

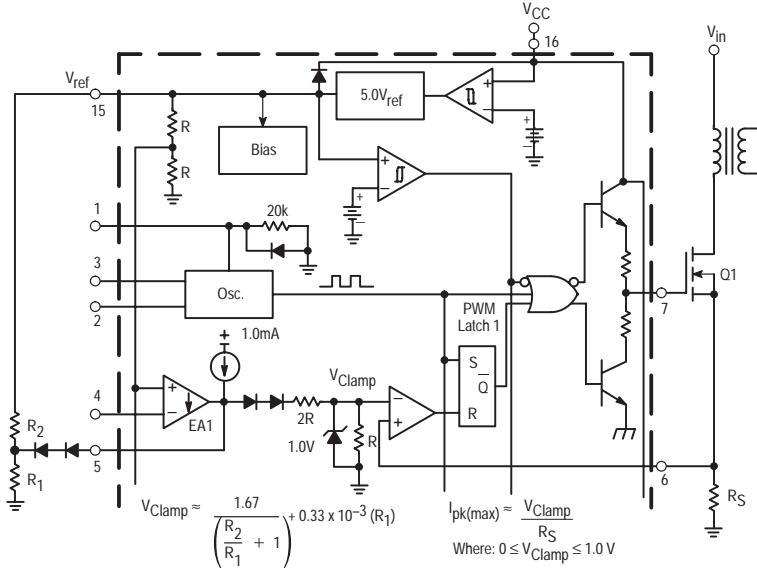

$$D_{\max} \text{ Drive Output } 2 = \frac{R_A}{R_A + R_B}$$

## PIN FUNCTION DESCRIPTION

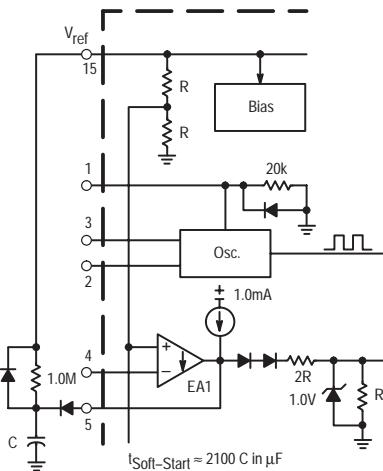

Pin	Function	Description
1	Sync Input	A narrow rectangular waveform applied to this input will synchronize the oscillator. A dc voltage within the range of 2.4 V to 5.5 V will inhibit the oscillator.
2	$C_T$	Timing capacitor $C_T$ connects from this pin to ground setting the free-running oscillator frequency range.
3	$R_T$	Resistor $R_T$ connects from this pin to ground precisely setting the charge current for $C_T$ . $R_T$ must be between 4.0 k and 16 k.
4	Voltage Feedback 1	This pin is the inverting input of Error Amplifier 1. It is normally connected to the switching power supply output through a resistor divider.
5	Compensation 1	This pin is the output of Error Amplifier 1 and is made available for loop compensation.
6	Current Sense 1	A voltage proportional to the inductor current is connected to this input. PWM 1 uses this information to terminate conduction of output switch Q1.
7	Drive Output 1	This pin directly drives the gate of a power MOSFET Q1. Peak currents up to 400 mA are sourced and sunk by this pin.
8	Gnd	This pin is the control circuitry ground return and is connected back to the source ground.
9	Drive Gnd	This pin is a separate power ground return that is connected back to the power source. It is used to reduce the effects of switching transient noise on the control circuitry.
10	Drive Output 2	This pin directly drives the gate of a power MOSFET Q2. Peak currents up to 400 mA are sourced and sunk by this pin.
11	Current Sense 2	A voltage proportional to inductor current is connected to this input. PWM 2 uses this information to terminate conduction of output switch Q2.
12	Compensation 2	This pin is the output of Error Amplifier 2 and is made available for loop compensation.
13	Voltage Feedback 2	This pin is the inverting input of Error Amplifier 2. It is normally connected to the switching power supply output through a resistor divider.
14	Drive Output 2 Enable	A logic low at this input disables Drive Output 2.
15	$V_{ref}$	This is the 5.0 V reference output. It can provide bias for any additional system circuitry.
16	$V_{CC}$	This pin is the positive supply of the control IC. The minimum operating voltage range after startup is 11 V to 15.5 V for the -H suffix, 8.2 V to 9.5 V for the -L suffix.

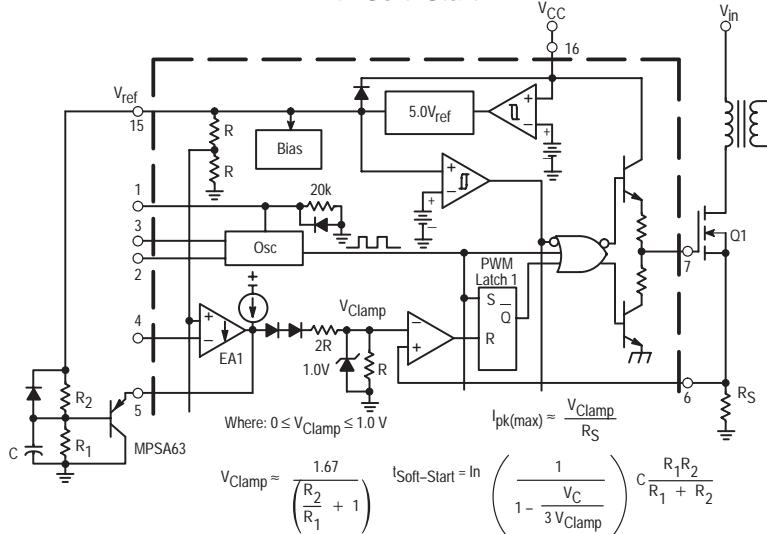

**Figure 19. Adjustable Reduction of Clamp Level**

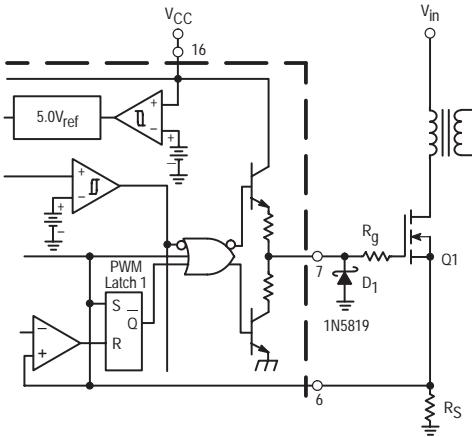

**Figure 20. Soft-Start Circuit**

**Figure 21. Adjustable Reduction of Clamp Level with Soft-Start**

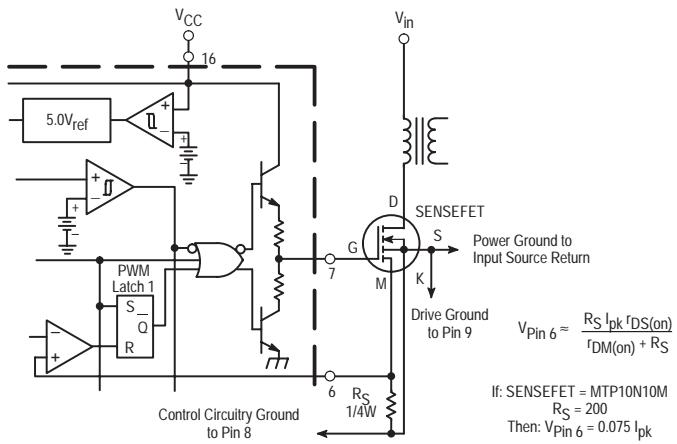

**Figure 22. MOSFET Parasitic Oscillations**

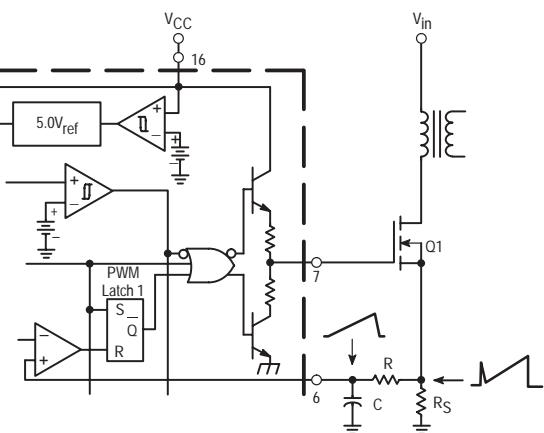

Series gate resistor  $R_g$  may be needed to damp high frequency parasitic oscillations caused by the MOSFET input capacitance and any series wiring inductance in the gate-source circuit.  $R_g$  will decrease the MOSFET switching speed. Schottky diode  $D_1$  is required if circuit ringing drives the output pin below ground.

**Figure 23. Current Sensing Power MOSFET**

Virtually lossless current sensing can be achieved with the implementation of a SENSEFET power switch. For proper operation during over current conditions, a reduction of the  $I_{pk(max)}$  clamp level must be implemented. Refer to Figures 19 and 21.

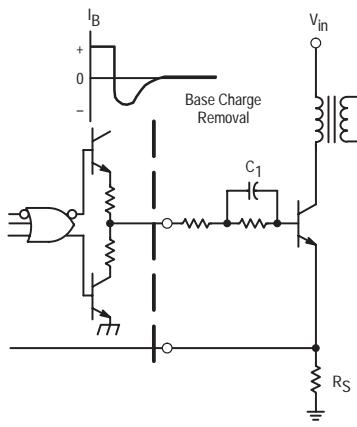

**Figure 24. Current Waveform Spike Suppression**

The addition of the RC filter will eliminate instability caused by the leading edge spike on the current waveform.

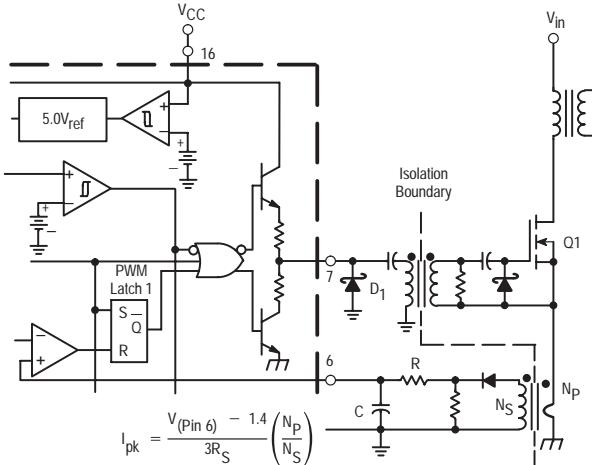

# MC34065-H, L MC33065-H, L

**Figure 25. Bipolar Transistor Drive**

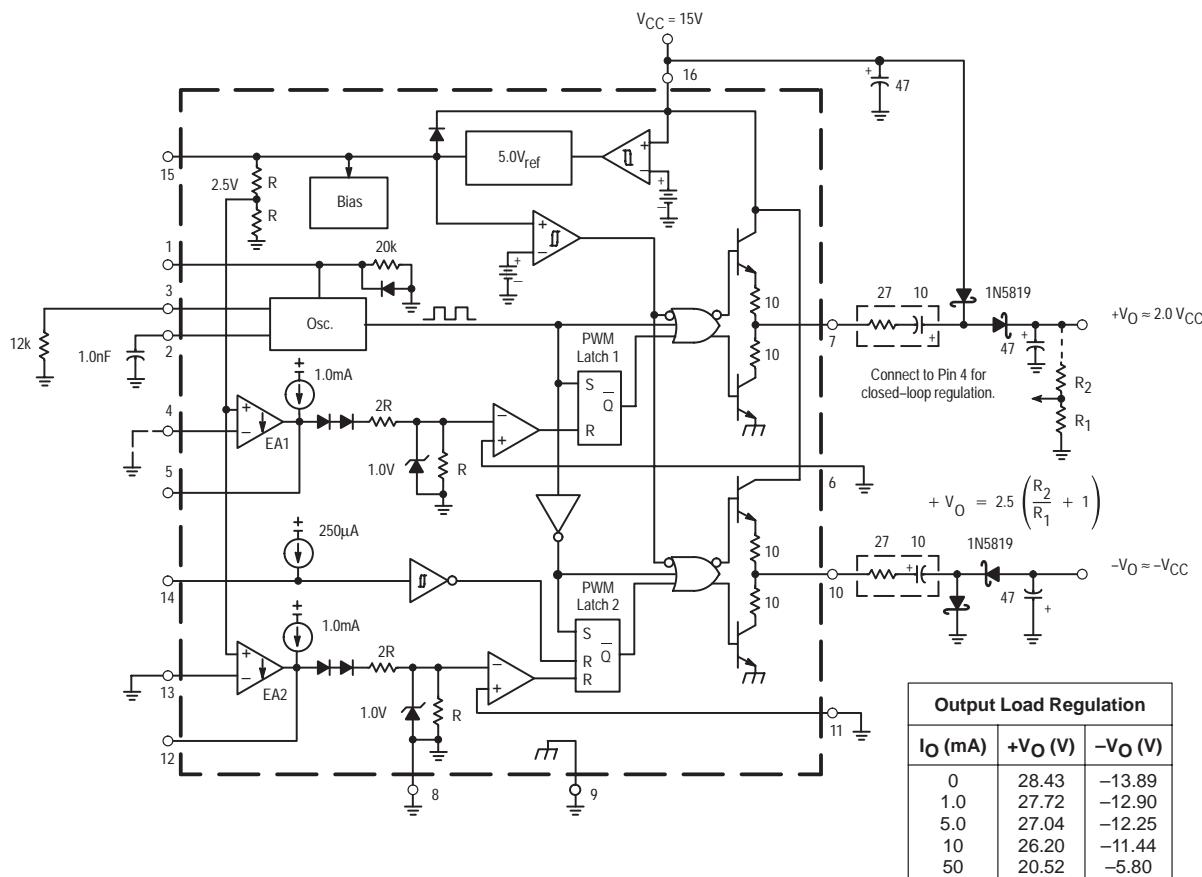

The totem-pole outputs can furnish negative base current for enhanced transistor turn-off, with the addition of capacitor C1.

**Figure 26. Isolated MOSFET Drive**

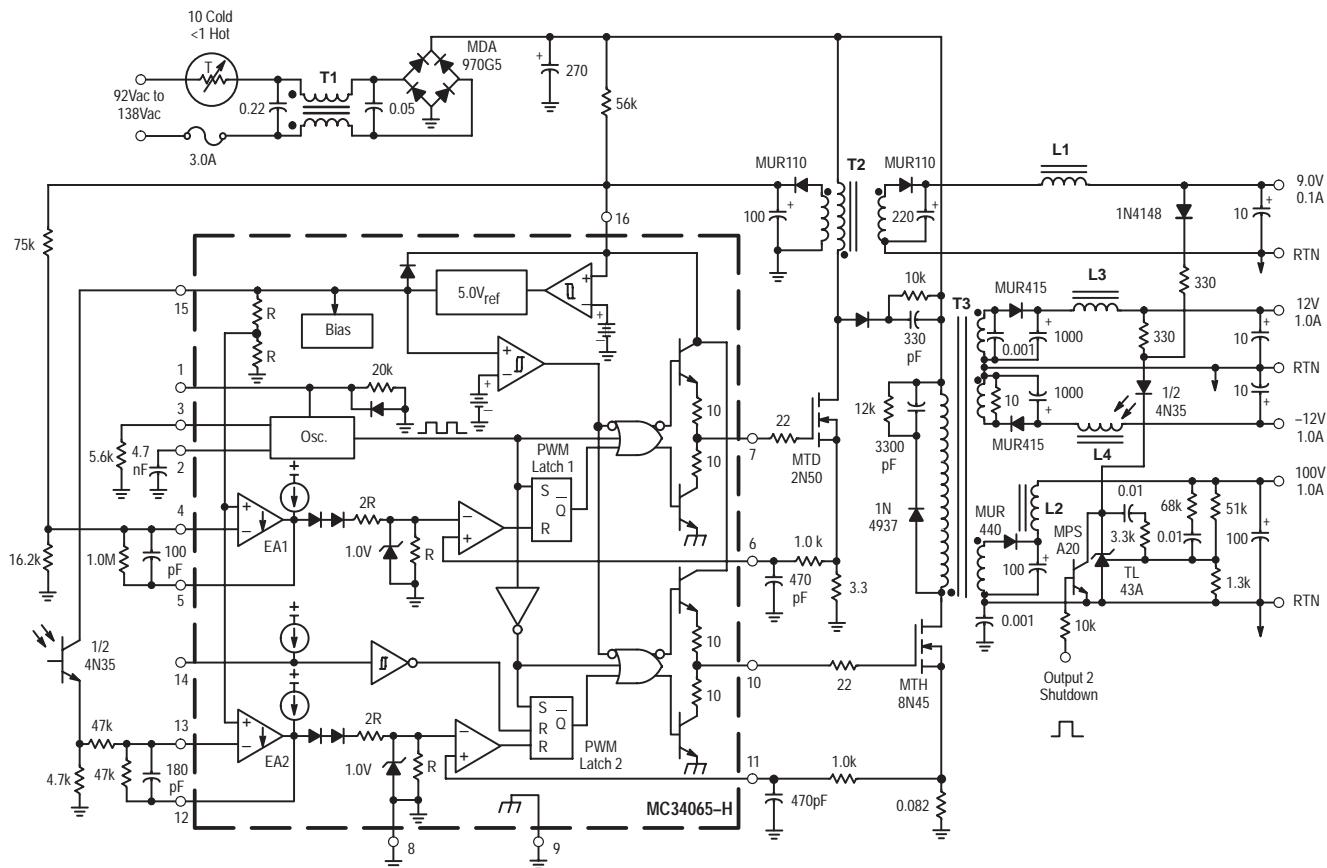

**Figure 27. Dual Charge Pump Converter**

The capacitor's equivalent series resistance must limit the Drive Output current to 400 mA. An additional series resistor may be required when using tantalum or other low ESR capacitors. The positive output can provide excellent line and load regulation by connecting the R<sub>2</sub>/R<sub>1</sub> resistor divider as shown.

# Tape and Reel Options

---

## In Brief . . .

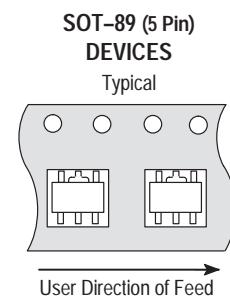

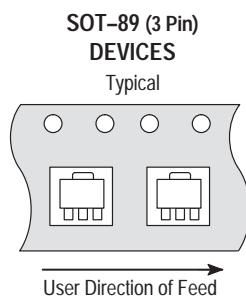

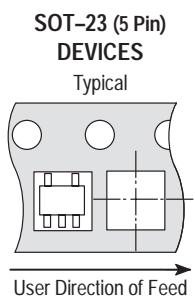

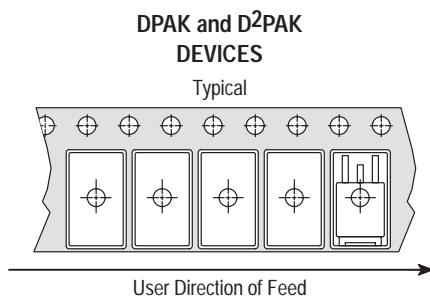

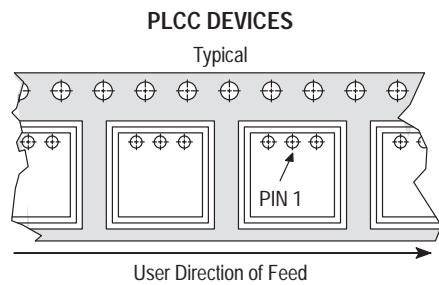

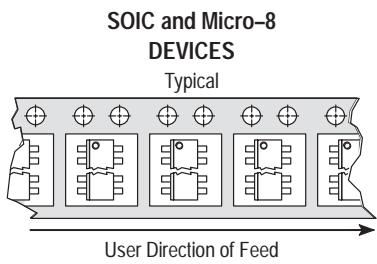

Motorola offers the convenience of Tape and Reel packaging for our growing family of standard integrated circuit products. Reels are available to support the requirements of both first and second generation pick-and-place equipment. The packaging fully conforms to the latest EIA-481A specification. The antistatic embossed tape provides a secure cavity, sealed with a peel-back cover tape.

Analog MPQ Table .....	12-5

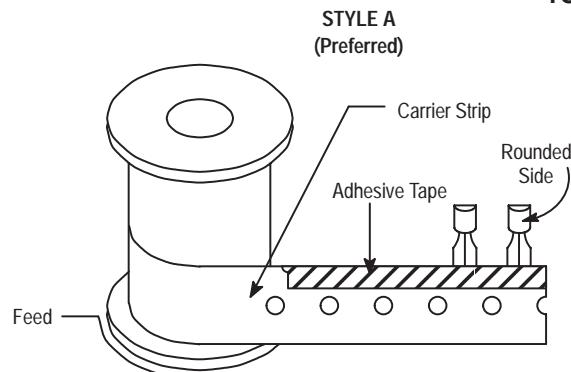

## Tape and Reel Configurations

### Mechanical Polarization

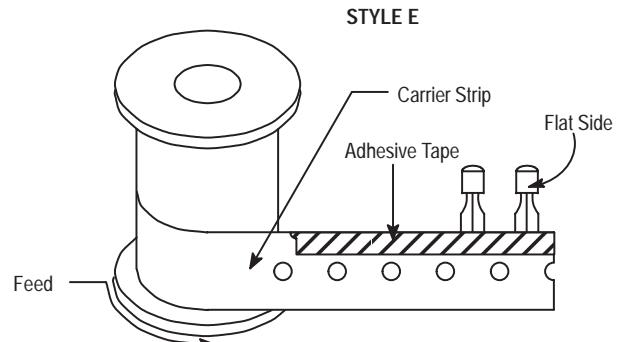

## Tape and Reel Configurations (continued)

### TO-92 Reel Styles

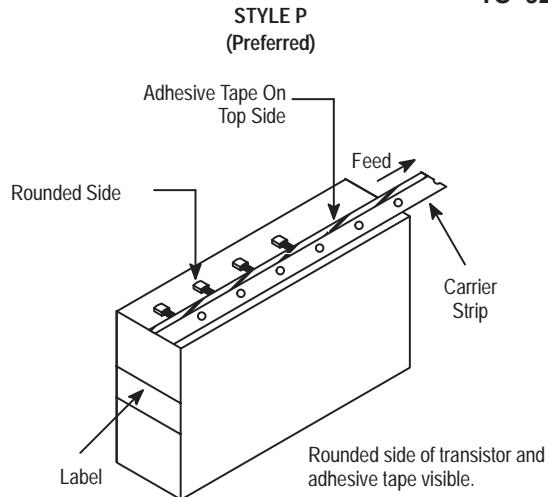

Rounded side of transistor and adhesive tape visible.

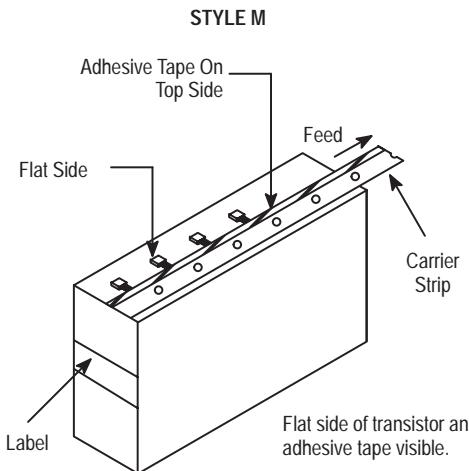

Flat side of transistor and adhesive tape visible.

### TO-92 Ammo Pack Styles

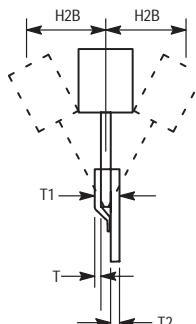

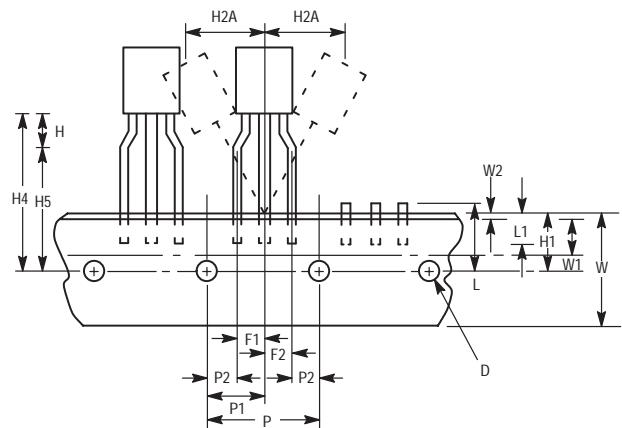

Style P ammo pack is equivalent to Styles A and B of reel pack dependent on feed orientation from box.

Style M ammo pack is equivalent to Style E of reel pack dependent on feed orientation from box.

### TO-92 EIA Radial Tape in Fan Fold Box or On Reel

# Tape and Reel Information Table

Package	Tape Width (mm)	Devices <sup>(1)</sup> per Reel	Reel Size (inch)	Device Suffix
SO-8, SOP-8	12	2,500	13	R2
SO-14	16	2,500	13	R2
SO-16	16	2,500	13	R2

TO-226AA (TO-92) <sup>(2)</sup>	18	2,000	13	RA, RE, RP, or RM (Ammo Pack) only
DPAK	16	2,500	13	RK
D <sup>2</sup> PAK	24	800	13	R4
SOT-23 (5 Pin)	8	3,000	7	TR
SOT-89 (3/5 Pin)	12	1,000	7	T1

(1) Minimum order quantity is 1 reel. Distributors/OEM customers may break lots or reels at their option, however broken reels may not be returned.

(2) Integrated circuits in TO-226AA packages are available in Styles A and E only, with optional "Ammo Pack" (Suffix RP or RM). The RA and RP configurations are preferred. For ordering information please contact your local Motorola Semiconductor Sales Office.

# Packaging Information

---

## In Brief . . .

The packaging availability for each device type is indicated on the individual data sheets and the Selector Guide. All of the outline dimensions for the packages are given in this section.

The maximum power consumption an integrated circuit can tolerate at a given operating ambient temperature can be found from the equation:

$$P_{D(TA)} = \frac{T_{J(max)} - T_A}{R_{\theta JA}(\text{Typ})}$$

where:

$P_{D(TA)}$  = Power Dissipation allowable at a given operating ambient temperature. This must be greater than the sum of the products of the supply voltages and supply currents at the worst case operating condition.

$T_{J(max)}$  = Maximum operating Junction Temperature as listed in the Maximum Ratings Section. See individual data sheets for  $T_{J(max)}$  information.

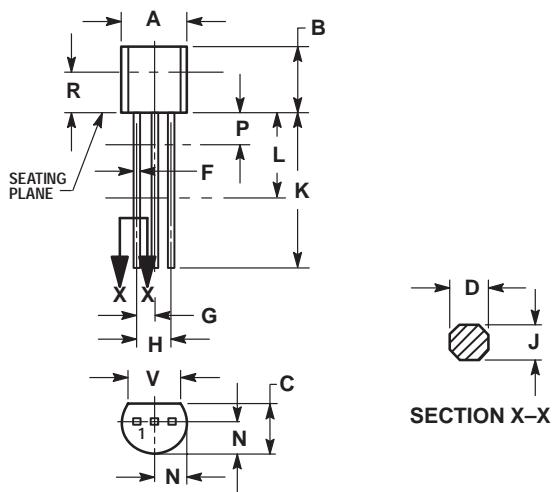

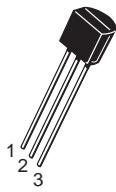

$T_A$  = Maximum desired operating Ambient Temperature

$R_{\theta JA}(\text{Typ})$  = Typical Thermal Resistance Junction-to-Ambient

 Plastic Package  
 (PLCC-20)  
 ISSUE C

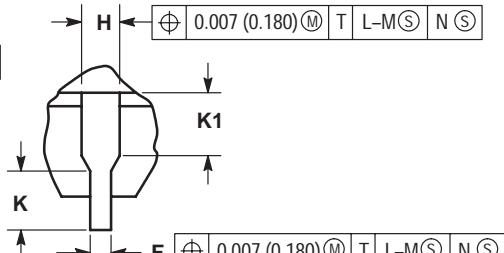

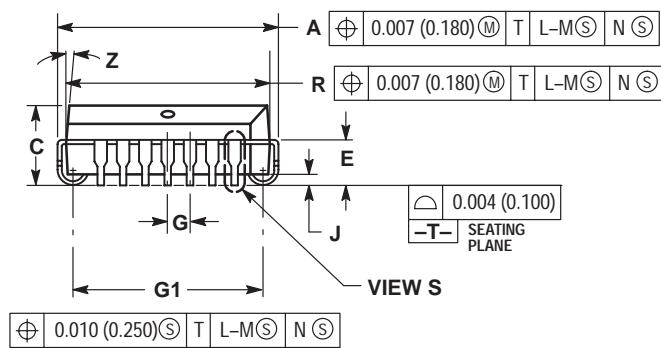

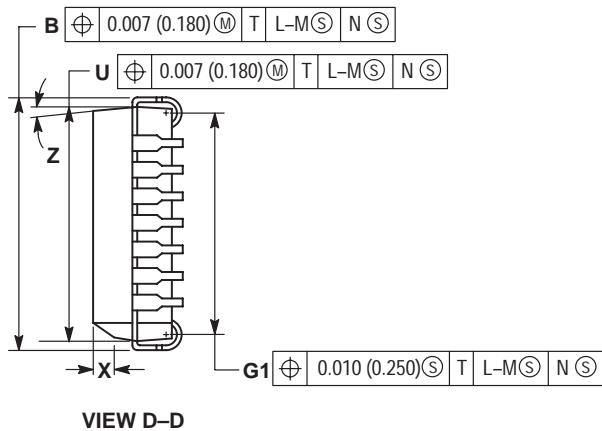

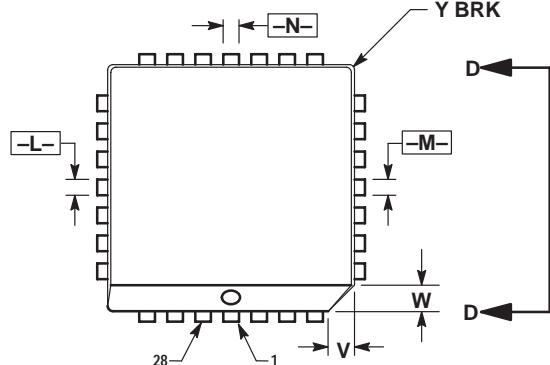

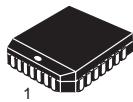

## NOTES:

1. DATUMS -L-, -M-, AND -N- DETERMINED WHERE TOP OF LEAD SHOULDER EXITS PLASTIC BODY AT MOLD PARTING LINE.
2. DIMENSION G1, TRUE POSITION TO BE MEASURED AT DATUM -T-, SEATING PLANE.
3. DIMENSIONS R AND U DO NOT INCLUDE MOLD FLASH. ALLOWABLE MOLD FLASH IS 0.010 (0.250) PER SIDE.
4. DIMENSIONING AND TOLERANCING PER ANSI Y14.5, 1982.
5. CONTROLLING DIMENSION: INCH.
6. THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM BY UP TO 0.012 (0.300). DIMENSIONS R AND U ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH, TIE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.
7. DIMENSION H DOES NOT INCLUDE DAMBAR PROTRUSION OR INTRUSION. THE DAMBAR PROTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE GREATER THAN 0.037 (0.940). THE DAMBAR INTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE SMALLER THAN 0.025 (0.635).
