

### Low Power Peak EMI Reducing Solution

#### Features

- Generates an EMI optimized clocking signal at the output.
- Integrated loop filter components.
- Operates with a 3.3V ±10% supply.
- Operating current less than 6mA.
- Low power CMOS design.
- Input frequency range: 6MHz to 12MHz.
- Generates a 1X low EMI spread spectrum clock of the input frequency.
- Frequency deviation: ±0.75%.
- Available in 6-pin TSOT-23, 8-pin SOIC and 8-pin TSSOP packages.

The ASM3P2760A uses the most efficient and optimized modulation profile approved by the FCC and is implemented by using a proprietary all digital method.

The ASM3P2760A modulates the output of a single PLL in order to “spread” the bandwidth of a synthesized clock, and more importantly, decreases the peak amplitudes of its harmonics. This results in significantly lower system EMI compared to the typical narrow band signal produced by oscillators and most frequency generators. Lowering EMI by increasing a signal’s bandwidth is called ‘spread spectrum clock generation’.

#### Product Description

The ASM3P2760A is a versatile spread spectrum frequency modulator designed specifically for a wide range of clock frequencies. The ASM3P2760A reduces electromagnetic interference (EMI) at the clock source, allowing system wide reduction of EMI of all clock dependent signals. The ASM3P2760A allows significant system cost savings by reducing the number of circuit board layers ferrite beads, shielding that are traditionally required to pass EMI regulations.

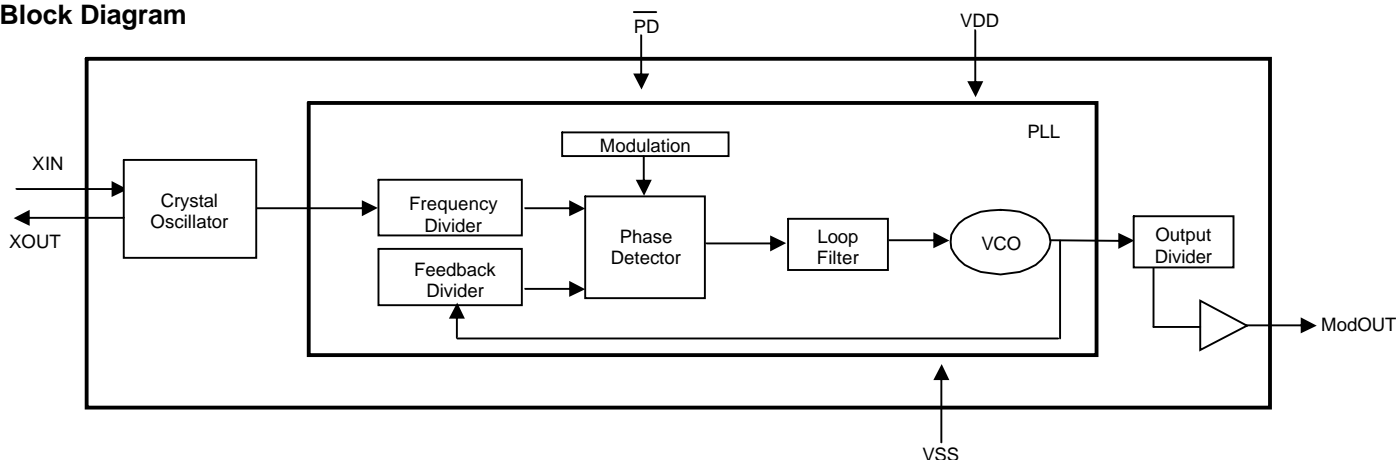

#### Applications

The ASM3P2760A is targeted towards all portable devices with very low power requirements like MP3 players and digital still cameras.
