

General Description

The SE5120 series of fixed output ultra low dropout linear regulators are designed for portable battery powered applications, which require low power consumption and low dropout voltage. Each device contains a bandgap voltage reference, an error amplifier, a PMOS power transistor, and current limit and temperature limit protection circuits.

The SE5120 is designed to work with low cost electrolytic and ceramic capacitors and requires a minimum output capacitor of 10 μ F.

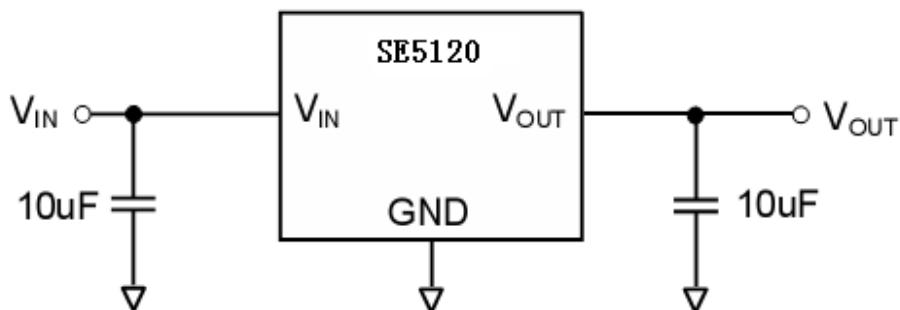

Features

- Typical 150mV Dropout Voltage at 500mA.
- Output Voltages: 0.8V to 3.9V (0.1V Step)
- Excellent Line and Load Regulation.
- High Accuracy Output Voltage of 2%.
- Ultra-Low Ground Current at 150 μ A (Typ.)
- Thermal and Over-Current Protection.
- Short Circuit Protection
- Standard SOT-223 and TO-252 Package.

Applications

- USB removable devices
- MPEG4 devices
- Wireless LAN's
- Hand-Held Instrumentation.
- Portable DVD players
- Digital camera

Note 1: Exceeding the absolute maximum rating may damage the device.

Note 2: The device is not guaranteed to function outside its operating rating.

Note 3: The maximum allowable power dissipation at any T_A (ambient temperature) is calculated using: P_{D(MAX)} = (T_{J(MAX)} – T_A)/θ_{JA}. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. See “Thermal Consideration” section for details

Note 4: Output voltage temperature coefficient is the worst case voltage change divided by the total temperature range.

SE5120

1.5A CMOS Ultra LDO Voltage Regulator

Note 5: Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1mA to 1200mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

Note 6: Dropout voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential.

Typical Performance Characteristics

Applications Information

Application Hints

Like any low dropout regulator, SE5120 requires external capacitors to ensure stability. The external capacitors must be carefully selected to ensure performance.

Input Capacitor

An input capacitor of at least 10 μ F is required. Ceramic or Tantalum can be used. The value can be increase without upper limit.

Output Capacitor

An output capacitor is required for stability. It must be placed no more than 1 cm away from the V_{OUT} pin, and connected directly between V_{OUT} and GND pins. The minimum value is 10 μ F but may be increase without limit.

Thermal Considerations

It is important that the thermal limit of the package is not exceeded. The SE5120 has built-in thermal protection. When the thermal limit is exceeded, the IC will enter protection, and V_{OUT} will be pulled to ground. The power dissipation for a given application can be calculated as following:

The power dissipation (P_D) is

$$P_D = I_{OUT} * [V_{IN} - V_{OUT}]$$

The thermal limit of the package is then limited to $P_{D(MAX)} = [T_J - T_A]/\Theta_{JA}$ where T_J is the junction temperature, T_A is the ambient temperature, and Θ_{JA} is around 155°C/W (SOT-223) for SE5120. SE5120 is designed to enter thermal protection at 170°C. For example, if T_A is 25°C then the maximum P_D is limited to about 0.94W. In other words, if I_{OUT(MAX)} = 1200mA, then [V_{IN} - V_{OUT}] cannot exceed 780mV.
