

## Low Jitter and Skew DC to 140MHz Clock Buffer

### Key Features

- DC to 140 MHz operating frequency range
- Low output clock skew: 50ps-typ
- Low part-to-part output skew: 100 ps-typ
- Low output propagation delay: 2.5ns-typ
- 3.3V +/-10% operation supply voltage
- Low power dissipation:
  - - 7 mA-typ at 33MHz
  - - 9 mA-typ at 66MHz
  - - 12 mA-typ at 133MHz
- One input to four output fanout buffer drivers
- Output Enable (OE) control function
- Available in 8-pin TSSOP package
- Available in Commercial and Industrial grades
- Available in Lead (Pb) free package

### Applications

- General Purpose PCI/PCI-X Clock Buffer
- Printers, MFPs and Digital Copiers
- PCs and Work Stations
- Routers, Switches and Servers
- Datacom and Telecom
- High-Speed Digital Embedded Systems

### Description

The SL2304NZ is a low skew, jitter and power fanout Buffer designed to produce up to four (4) clock outputs from one (1) reference input clock, for high speed clock distribution, including PCI/PCI-X applications.

The SL2304NZ products operate from DC to 140MHz.

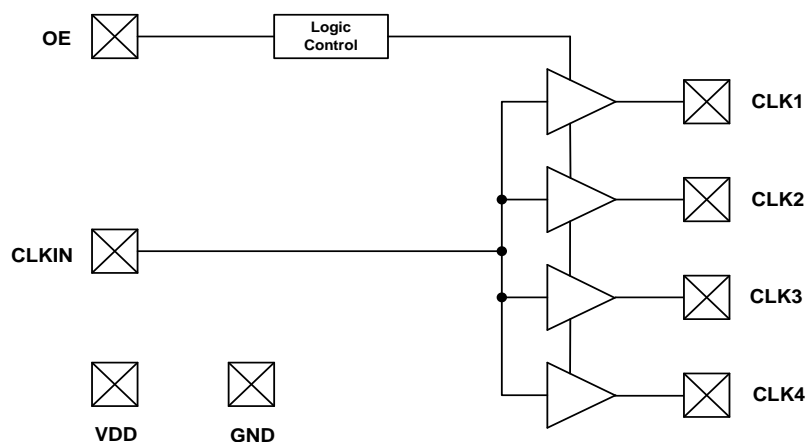

The only difference between SL2304NZ-1 and SL2304NZ-1Z is the OE logic implementation. Refer to the Available OE Logic Configuration Table. 1

Refer to SL23EP04NZ products for DC to 220MHz-max frequency range and 2.5V to 3.3V power supply operation, improved skew, jitter and higher drive options.

### Benefits

- Up to four (4) distribution of input clock
- Low propagation delay
- Low output-to-output skew
- Low output clock Jitter
- Low power dissipation

**General Description**

The SL2304NZ is a low skew, jitter and power fanout Buffer designed to produce up to four (4) clock outputs from one (1) reference input clock, for high speed clock distribution, including PCI/PCI-X applications.

**Input and output Frequency Range**

The input and output frequency is the same (1x) for SL2304NZ-1 and SL2304NZ-1Z and operates from DC to 140MHz clock range with up to 25pF output load.

**OE (Output Enable) Function**

The only difference between SL2304-1 and SL2304NZ-1Z is the OE logic implementation. When OE=0, SL2304NZ-1 outputs are disabled and outputs are at Logic Low. In the case of SL2304NZ-1Z the outputs are at High-Z. Refer to the Available OE Logic Configuration Table. 1 below.

**Output Clock Skew**

All outputs should drive the similar load to achieve output-to-output skew and input-to-output delay specifications as given in the switching electrical tables.

**Power Supply Range (VDD)**

The SL2304NZ is designed to operate 3.3V+/-10% (3.63V-max to 2.97V-min) VDD power supply range. An internal on-chip voltage regulator is used to provide to constant power supply of 1.8V, leading to a consistent and stable electrical performance in terms of skew and jitter. The SL2304NZ I/O is powered by using VDD.

Refer to SL23EP04NZ products for DC to 220MHz-max frequency range, 2.5V to 3.3V power supply operation, improved skew, jitter and higher drive options.

### External Components & Design Considerations

#### Typical Application Schematic

#### Recommendations

**Decoupling Capacitor:** A decoupling capacitor of 0.1µF must be used between VDD and VSS pins. Place the capacitor on the component side of the PCB as close to the VDD pin as possible. The PCB trace to the VDD pin and to the GND via should be kept as short as possible. Do not use vias between the decoupling capacitor and the VDD pin.
