

# 28 V, 150 mA Voltage Regulator with Stand-by Mode

## FEATURES

- Operating Voltage Range 2.0 V – 28.0 V
- Output Voltage Range from 2.0 V to 12.0 V with 0.1 V increments (B series) or 2.0 V – 23 V with external resistors (C series)
- Output Voltage Accuracy  $\pm 2\%$
- Dropout Voltage 300 mV @  $I_{OUT} = 20$  mA
- Temperature Stability  $\pm 30$  ppm/ $^{\circ}$ C
- Low Power Consumption of 5  $\mu$ A at  $V_{OUT} = 5.0$  V
- Output Current up to 150 mA (200 mA limit) at  $V_{IN} = V_{OUT} + 3$  V
- Standby Current less than 0.1  $\mu$ A typical
- Power Supply Ripple Rejection 30 dB at 1 kHz
- Current Limit and Short Circuit Protection
- Low ESR Ceramic Capacitor compatible
- ON/OFF switch,
- Thermal shutdown
- Operating Ambient Temperature - 40 + 85 $^{\circ}$ C
- Packages : SOT-25, SOT- 89, SOT-89-5, SOP-8FD, USP-6C, SOT-223, and TO-252
- EU RoHS Compliant, Pb Free

## APPLICATIONS

- Mobile phones
- Car Audio and Navigation Systems
- Cameras, VCRs
- Various portable equipment

## DESCRIPTION

The IXD1216 is positive voltage regulator with operation voltage up to 28V, manufactured by CMOS process.

The IC consists of a voltage reference, an error amplifier, a current limiter, a thermal protection, a phase compensation circuit, and a driver transistor.

The output voltage is selectable in 0.1 V increments within the range from 2.0 V to 12 V for B and D series and from 2.0 V to 23 V with external resistors for C series. High precision output voltage achieved by laser trimming technology.

The IXD1216 is stable with low ESR ceramic output capacitor ( $C_L$ ). The over current protection circuit and the thermal shutdown are built-in. These two protection circuits operate when the output current reaches current limit level or the junction temperature reaches temperature limit.

The Chip Enable (CE) function allows set IXD1216 into standby mode, reducing current consumption to less than 0.1  $\mu$ A typically.

The IXD1216 is available in SOT-25, SOT-89, SOT-89-5, SOP-8FD, USP-6C, SOT-223, and TO-252 packages.

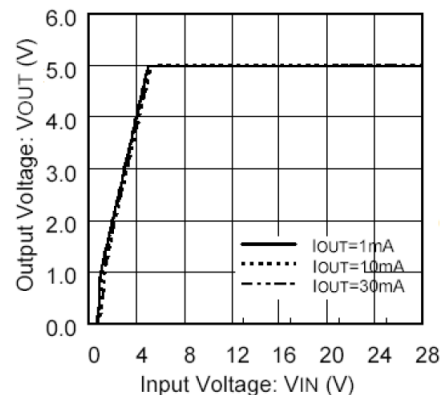

## TYPICAL APPLICATION CIRCUIT

## TYPICAL PERFORMANCE CHARACTERISTIC

Output Voltage vs. Input Voltage (IXD1216B/D502)

$C_{IN} = C_L = 1 \mu F, T_a = 25^{\circ}C,$

## ABSOLUTE MAXIMUM RATINGS

PARAMETER		SYMBOL	RATINGS	UNITS
Input Voltage		$V_{IN}$	- 0.3 ~ +30	V
Output Current		$I_{OUT}$	300 <sup>1)</sup>	mA
Output Voltage		$V_{OUT}$	- 0.3 ~ $V_{IN} + 0.3$ or +30 <sup>2)</sup>	V
CE Input Voltage (IXD1216B/C version only)		$V_{CE}$	- 0.3 ~ $V_{IN} + 0.3$ or +30 <sup>2)</sup>	V
FB Voltage (IXD1216C version only)		$V_{FB}$	- 0.3 ~ $V_{IN} + 0.3$ or +30 <sup>2)</sup>	V
Power Dissipation <sup>2)</sup>	SOT-25	$P_D$	250	mW
			600 (PCB mounted)	
	SOT-89		500	
			1000 (PCB mounted)	
	SOT-89-5		500	
			1300 (PCB mounted)	
	USP-6C		120	
			1000 (PCB mounted)	
	SOT223		300	
1500 (PCB mounted)				
TO-252	500			
	1800 (PCB mounted)			
SOP-8FD	300			
	1500 (PCB mounted)			
Operating Temperature Range		$T_{OPR}$	- 40 ~ + 85	°C
Storage Temperature Range		$T_{STG}$	- 55 ~ +125	°C

All voltages are in respect to  $V_{SS}$

- 1)  $I_{OUT} \leq Pd / (V_{IN} - V_{OUT})$
- 2) The lowest value between  $V_{IN} + 0.3$  and 30 V
- 3) This is a reference data taken by using the test board. Please refer to page 24 to 30 for details

**ELECTRICAL OPERATING CHARACTERISTICS**

**NOTE:**

Unless otherwise stated, V<sub>IN</sub> = V<sub>CE</sub> = V<sub>OUT(T)</sub> + 2.0 V

- 1) V<sub>OUT(T)</sub> is Nominal output voltage and V<sub>OUT(E)</sub> is Effective output voltage, (i.e. the output voltage when "V<sub>OUT(T)</sub> + 1.0V" is provided at the V<sub>IN</sub> pin, while maintaining a certain I<sub>OUT</sub> value).
- 2) V<sub>DIF</sub> = {V<sub>IN</sub> - V<sub>OUT</sub>}, where V<sub>IN1</sub> is the input voltage when V<sub>OUT</sub> = 0.98 V<sub>OUT(T)</sub> appears, while input voltage gradually decreases
- 3) Refer to the Table "Voltage Chart, Output Voltage"
- 4) Refer to the Table "Voltage Chart, Dropout Voltage"
- 5) IXD1216B/C versions only
- 6) IXD1216C version only

**PIN CONFIGURATION**

The dissipation pad for the USP-6C package should be solder-plated in respect with mounting pattern and metal mask to improve heat dissipation and mounting strength. If the pad needs to be connected to other pins, it should be connected to the VSS (No. 5) pin.

			2			2, 3, 7	NC	No Connection
3		4	4			5		No Connection (B series)/FB (C series)

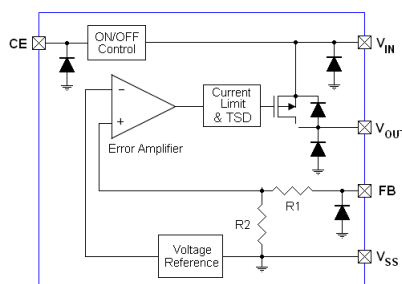

1) CE pin does not have internal pull-down resistor. IC state is undefined, if this pin is open.

**BLOCK DIAGRAMS**

**IXD1216B**

**IXD1216C**

**IXD1216D**

Diodes inside the circuits are ESD protection diodes and parasitic diodes.

## BASIC OPERATION

The Error Amplifier of the IXD1216 series monitors output voltage divided by internal resistors R1 & R2 and compares it with the internal Reference Voltage (see Block Diagram above). The output signal from error amplifier drives gate of the P-channel MOSFET, which is connected to the V<sub>OUT</sub> pin and operates as a series voltage regulator.

The Current Limit/Short Protection circuits monitor level of the output current, and Thermal shutdown circuit monitors MOSFET junction temperature to prevent IC damage by excessive current.

The CE pin allows shutdown internal circuitry to minimize power consumption.

### Current Limiter, Short-Circuit Protection

The IXD1216 series have a current limiter circuit & a fold back circuit, which aid the operations of the current limiter and circuit protection. When the load current reaches the current limit level, the fixed current limiter circuit activates and output voltage drops. Because of this drop, the fold back circuit activates too, and output voltage drops further decreasing output current. When the output pin is shorted, a current of about 30 mA flows.

### Thermal Shutdown

When the junction temperature of the built-in transistor reaches the temperature limit, the thermal shutdown circuit activates and turns transistor OFF. The IC resumes normal operation when the junction temperature falls below value determined by Thermal Shutdown Hysteresis.

### CE Pin

The CE pin allows shutdown internal circuitry to minimize power consumption. In shutdown mode, output at the V<sub>OUT</sub> pin is pulled down to the V<sub>SS</sub> level by resistors R1 and R2 connected in series.

Note that the CE input is active HIGH and has no pull down resistor. IC will be in undefined state, if CE pin is open. CE pin should be connected to either V<sub>IN</sub> or ground. IC current consumption may increase, if voltage applied to this pin is ~ 0.5 of V<sub>IN</sub>.

### Minimum Operating Voltage

The input voltage should be above 2.0 V for the stable IC operation.

## TYPICAL APPLICATION CIRCUIT

IXD1216B version

IXD1216C version

IXD1216D version

## LAYOUT AND USE CONSIDERATIONS

1. Mount external component as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
2. The IC may malfunction if absolute maximum ratings are exceeded.
3. If power source of this regulator is a high impedance device, an input capacitor C<sub>IN</sub> ≥ 0.1µF should be used to prevent oscillations.
4. The internal phase compensation guarantees the IXD1216 stable operations even without load capacitor C<sub>L</sub>. However, load capacitor C<sub>L</sub> = 0.1 – 1.0 µF located as close to V<sub>OUT</sub> and V<sub>SS</sub> pins may improve regulator's dynamic characteristics, reducing over/undershoot at heavy load.
5. In case of high output current, increasing the input capacitor value can stabilize operations.
6. Please ensure that output current I<sub>OUT</sub> is less than P<sub>D</sub> / (V<sub>IN</sub> - V<sub>OUT</sub>), where P<sub>D</sub> is a rated power dissipation value of the package shown at ABSOLUTE MAXIMUM RATING table to not exceed it.
7. The IXD1216C version requires external resistive divider to set output voltage above 2.0 V. Output voltage determined by resistors R<sub>21</sub>/R<sub>22</sub> as well as resistance of the internal resistive divider R<sub>FB</sub>, which is in the range from 1.7 MΩ to 6.3 MΩ.

$$V_{OUT} = 2.0V \times \left( \frac{R_{21} + R_{22}}{R_{22}} + \frac{R_{21}}{R_{FB}} \right)$$

Component  $R_{21}/R_{FB}$  determines error in voltage setting and it should be taken into considerations, if  $R_{21}$  value is close to value of  $R_{FB}$ . If  $R_{21}$  is less than 10 k $\Omega$ , this error is negligible.

Example:

If  $R_{21} = 64.9 \text{ k}\Omega$  and  $R_{22} = 100 \text{ k}\Omega$ , output voltage may vary from part to part due difference in  $R_{FB}$  from 3.318 V to 3.374 V.

If  $R_{21} = 6.49 \text{ }\Omega$  and  $R_{22} = 10 \text{ k}\Omega$ , output voltage will vary from part to part due difference in  $R_{FB}$  from 3.300 V to 3.306 V.

The power dissipation varies with the mount board conditions. Please use this data as a reference only.

1. Measurement Conditions:

- Condition: Mount on a board
- Ambient: Natural convection
- Soldering: Lead (Pb) free
- Board: Dimensions 40x40 mm (1600 mm<sup>2</sup> in one side)  
Copper (Cu) traces occupy 50% of the board area on top and bottom layers  
Package heat sink tied to the copper traces.
- Material: Glass Epoxy (FR-4)
- Thickness: 1.6 mm
- Through-hole: 4 x 0.8 Diameter

2. Power Dissipation vs. Ambient Temperature

Board Mount (T<sub>jmax</sub> = 125 °C)

Ambient Temperature, °C	Power Dissipation Pd, mW	Thermal Resistance, °C/W
25	1800	55.56
85	720	

Evaluation Board (Unit: mm)

**PACKAGE POWER DISSIPATION (CONTINUED)**

**SOP-8FD Power Dissipation**

**Warning:** DO NOT USE THIS PRODUCT IN LIFE SUPPORT SYSTEMS.

---

**LIFE SUPPORT POLICY** ZILOG'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF ZILOG CORPORATION.

**As used herein** Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
