

M27C801

8 Mbit (1Mb x8) UV EPROM and OTP EPROM

- 5V ± 10% SUPPLY VOLTAGE in READ OPERATION
- FASTACCESS TIME: 45ns
- LOW POWER CONSUMPTION:
 - Active Current 35mA at 5MHz
 - Standby Current 100µA
- PROGRAMMING VOLTAGE: 12.75V ± 0.25V
- PROGRAMMING TIME: 100µs/byte (typical)
- ELECTRONIC SIGNATURE
 - Manufacturer Code: 20h
 - Device Code: 42h

DESCRIPTION

The M27C801 is an 8 Mbit EPROM offered in the two ranges UV (ultra violet erase) and OTP (one time programmable). It is ideally suited for applications where fast turn-around and pattern experimentation are important requirements and is organized as 1,048,576 by 8 bits.

The FDIP32W (window ceramic frit-seal package) has transparentlid which allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written to the device by following the programming procedure.

For applications where the content is programmed only one time and erasure is not required, the M27C801 is offered in PDIP32, PLCC32 and TSOP32 (8 x 20 mm) packages.

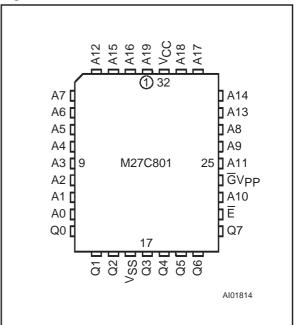

Figure 2C. TSOP Pin Connections

DEVICE OPERATION

The operating modes of the M27C801 are listed in the Operating Modes table. A single power supply is required in the read mode. All inputs are TTL levels except for $\overline{GV_{PP}}$ and 12V on A9 for Electronic Signature and Margin Mode Set or Reset.

Figure 2B. PLCC Pin Connections

Read Mode

The M27C801 has two control functions, both of which must be logically active in order to obtain data at the outputs. Chip Enable (\overline{E}) is the power control and should be used for device selection. Output Enable (\overline{G}) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that the addresses are stable, the address access time (t_{AVQV}) is equal to the delay from \overline{E} to output (t_{ELQV}). Data is available at the output after a delay of t_{GLQV} from the falling edge of \overline{G} , assuming that \overline{E} has been low and the addresses have been stable for at least t_{AVQV}-t_{GLQV}.

Standby Mode

The M27C801 has a standby mode which reduces the supply current from 35mA to $100\mu\text{A}$ The M27C801 is placed in the standby mode by applying a CMOS high signal to the E input. When in the standbymode, the outputs are in a high impedance state, independent of the GV_{PP} input.

Two Line Output Control

Because EPROMs are usually used in larger memory arrays, the product features a 2 line control function which accommodates the use of multiple memory connection. The two line control function allows:

- a. the lowest possible memory power dissipation,
- b. complete assurance that output bus contention will not occur.

Symbol	Parameter	Value	Unit
T _A	Ambient Operating Temperature ⁽³⁾	-40 to 125	°C
T _{BIAS}	Temperature Under Bias	-50 to 125	°C
T _{STG}	Storage Temperature	-65 to 150	°C
Vio ⁽²⁾	Input or Output Voltages (except A9)	-2 to 7	V
V _{CC}	Supply Voltage	-2 to 7	V
V _{A9} ⁽²⁾	A9 Voltage	-2 to 13.5	V
V _{PP}	Program Supply Voltage	-2 to 14	V

Table 2. Absolute Maximum Ratings⁽¹⁾

Notes: 1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

2. Minimum DC voltage on Input or Output is -0.5V with possible undershoot to -2.0V for a period less than 20ns. Maximum DC voltage on Output is V_{CC} +0.5V with possible overshoot to V_{CC} +2V for a period less than 20ns.

3. Depends on range.

Table 3. Operating Modes

Mode	Ē	GVPP	A9	Q0 - Q7
Read	V _{IL}	V _{IL}	Х	Data Out
Output Disable	VIL	VIH	Х	Hi-Z
Program	V _{IL} Pulse	V _{PP}	Х	Data In
Program Inhibit	V _{IH}	V _{PP}	Х	Hi-Z
Standby	VIH	Х	Х	Hi-Z
Electronic Signature	V _{IL}	V _{IL}	V _{ID}	Codes

Note: X = VIH or VIL, VID = $12V \pm 0.5V$.

Table 4. Electronic Signature

Identifier	A0	Q7	Q6	Q5	Q4	Q3	Q2	Q1	Q0	Hex Data
Manufacturer's Code	V _{IL}	0	0	1	0	0	0	0	0	20h
Device Code	V _{IH}	0	1	0	0	0	0	1	0	42h

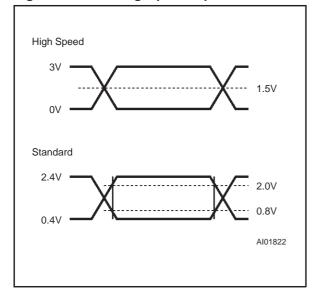

For the most efficient use of these two control lines, \overline{E} should be decoded and used as the primary device selecting function, while \overline{G} should be made a common connection to all devices in the array and connected to the READ line from the system control bus. This ensures that all deselected memory devices are in their low power standby mode and that the output pins are only active when data is required from a particular memory device.

System Considerations

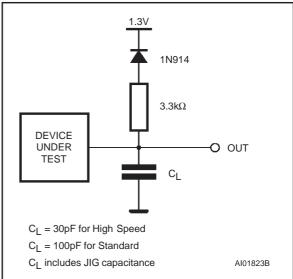

The power switching characteristics of Advanced CMOS EPROMs require careful decoupling of the devices. The supply current, I_{CC} , has three segments that are of interest to the system designer: the standby current level, the active current level, and transient current peaks that are produced by the falling and rising edges of E. The magnitude of the transient current peaks is dependent on the capacitive and inductive loading of the device at the output.

Table 5. AC Measurement Conditions

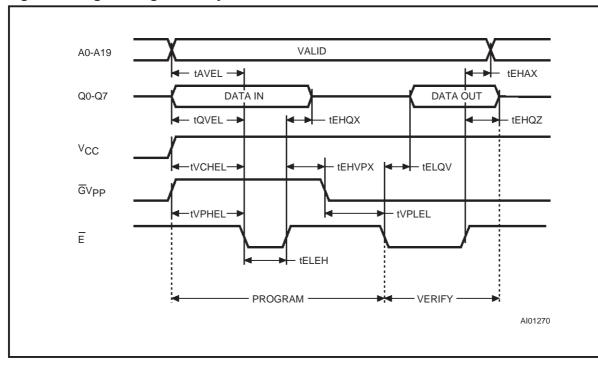

Figure 7. Programming and Verify Modes AC Waveforms

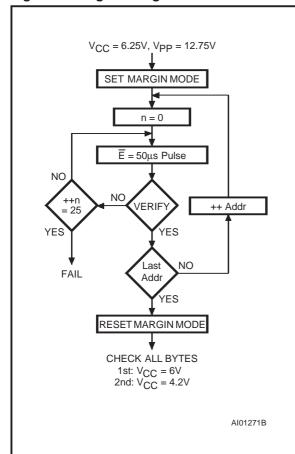

Figure 8. Programming Flowchart

DEVICE OPERATION (cont'd)

The associated transient voltage peaks can be suppressed by complying with the two line output control and by properly selected decoupling capacitors. It is recommended that a $0.1\mu F$ ceramic capacitor be used on every device between V_{CC} and V_{SS} . This should be a high frequency capacitor of low inherent inductance and should be placed as close to the device as possible. In addition, a $4.7\mu F$ bulk electrolytic capacitor should be used between V_{CC} and V_{SS} for every eight devices. The bulk capacitor should be located near the power supply connection point. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of PCB traces.

Programming

When delivered (and after each erasure for UV EPROM), all bits of the M27C801 are in the '1' state. Data is introduced by selectively programming '0's into the desired bit locations. Although only '0' will be programmed, both '1' and '0' can be present in the data word. The only way to change a '0' to a '1' is by die exposure to ultraviolet light (UV EPROM). The M27C801 is in the programming mode when VPP input is at 12.75V and \vec{E} is pulsed to V_{IL}. The data to be programmed is applied to 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL. V_{CC} is specified to be $6.25V \pm 0.25V$.

PRESTO IIB Programming Algorithm

PRESTO IIB Programming Algorithm allows the whole array to be programmed with a guaranteed margin, in a typical time of 52.5 seconds. This can be achieved with STMicroelectronics M27C801 due to several design innovations to improve programming efficiency and to provide adequate margin for reliability. Before starting the programming the internal MARGIN MODE circuit is set in order to guarantee that each cell is programmed with enough margin. Then a sequence of 50µs program pulses are applied to each byte until a correct verify occurs. No overprogram pulses are applied since the verify in MARGIN MODE provides the necessary margin.

Program Inhibit

Programming of multiple M27C801s in parallel with different data is also easily accomplished. Except for \overline{E} , all like inputs including $\overline{GV_{PP}}$ of the parallel M27C801 may be common. A TTL low level pulse applied to a M27C801's \overline{E} input, with V_{PP} at 12.75V, will program that M27C801. A high level \overline{E} input inhibits the other M27C801s from being programmed.

Program Verify

A verify (read) should be performed on the programmed bits to determine that they were correctly programmed. The verify is accomplished with \overline{G} at V_{IL}. Data should be verified with t_{ELQV} after the falling edge of \overline{E} .

On-Board Programming

The M27C801 can be directly programmed in the application circuit. See the relevant Application Note AN620.

Electronic Signature

The Electronic Signature (ES) mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment to automatically match the device to be programmed with its corresponding programming algorithm. The ES mode is functional in the $25^{\circ}C \pm 5^{\circ}C$ ambient temperature range that is required when programming the M27C801. To activate the ES mode, the programming equipment must force 11.5V to 12.5V on address line A9 of the M27C801. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from V_{IL} to V_{IH}. All other address lines must be held at V_{IL} during Electronic Signature mode.

Byte 0 (A0=V_{IL}) represents the manufacturer code and byte 1 (A0=V_{IH}) the device identifier code. For the STMicroelectronics M27C801, these two identifier bytes are given in Table 4 and can be read-out on outputs Q0 to Q7.

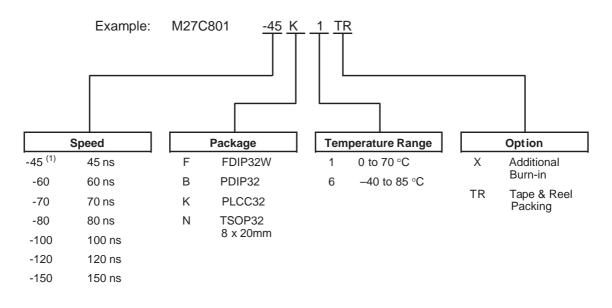

ERASURE OPERATION (applies to UV EPROM)

The erasure characteristics of the M27C801 is such that erasure begins when the cells are exposed to light with wavelengths shorter than approximately 4000 Å. It should be noted that sunlight and some type of fluorescent lamps have wavelengths in the 3000-4000 Å range.

Research shows that constant exposure to room level fluorescent lighting could erase a typical M27C801 in about 3 years, while it would take approximately 1 week to cause erasure when exposed to direct sunlight. If the M27C801 is to be exposed to these types of lighting conditions for extended periods of time, it is suggested that opaque labels be put over the M27C801 window to prevent unintentional erasure. The recommended erasure procedure for the M27C801 is exposure to short wave ultraviolet light which has wavelength 2537 Å. The integrated dose (i.e. UV intensity x exposure time) for erasure should be a minimum of 30 W-sec/cm². The erasure time with this dosage is approximately 30 to 40 minutes using an ultraviolet lamp with 12000 µW/cm² power rating. The M27C801 should be placed within 2.5 cm (1 inch) of the lamp tubes during the erasure. Some lamps have a filter on their tubes which should be removed before erasure.

ORDERING INFORMATION SCHEME

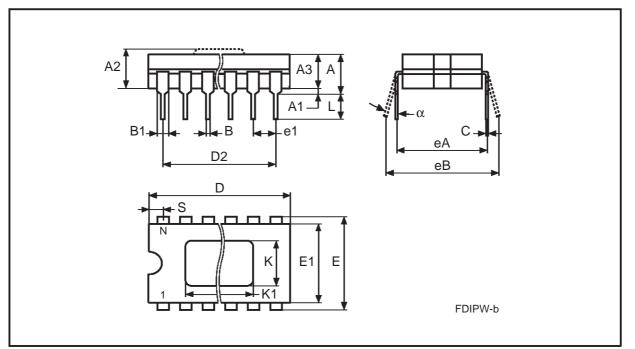

Note: 1. High Speed, see AC Characteristics section for further information.

For a list of available options (Speed, Package, Temperature Range, etc...) or for further information on any aspect of this device, please contact the STMicroelectronics Sales Office nearest to you.
