SL6610 Direct Conversion FSK Data Receiver

Advance Information

Supersedes the October 1994 edition, DS4003 - 1.4

DS4003 - 2.2 September 1995

This device is an advanced direct conversion receiver for operation up to 470MHz. The design is based on the SL6609A but is specifically designed for use in very small pagers i.e. credit card sized, where local oscillator re-radiation is a problem. This design has overcome this difficulty.

The device also includes a 1 volt regulator capable of sourcing up to 5mA, a battery flag and the facility of incorporating a more complex post detection filter off-chip. Both battery flag and data outputs have open collector outputs to ease their interface with other devices.

Adjacent channel rejection is provided using tuneable gyrator filters. To assist operation in the presence of large interfering signals both RF and audio AGC functions are provided.

FEATURES

- Very low power operation typ 3.0mW
- Superior sensitivity of -130dBm
- Operation at wide range of paging data rates 512, 1200, 2400 baud
- Small package offering SSOP
- Excellent performance of LO Rejection

APPLICATIONS

- Credit card pagers
- Watch pagers
- Small form factor pagers i.e. PCMCIA

OPERATION OF SL6610

The SL6610 is a Direct Converson Receiver designed for use up to 470MHz. It is available in a 28 pin SSOP package and it integrates all the facilities required for the conversion of an RF FSK signal to a base-band data signal.

Low Noise Amplifier

To achieve optimum performance it is necessary to incorporate a Low Noise RF Amplifier at the front end of the receiver. This is easily biased using the on chip voltage and current sources provided.

All voltages and current sources used for bias of the RF amplifier, receiver and mixers should be RF decoupled using suitable capacitors (see fig.4 for a suitable Low-Noise-Amplifier).

Local Oscillator

The Local Oscillator signal is applied to the device in phase quadrature. This can be achieved with the use of two RC networks operating at the -3dB/45° transfer characteristic, giving a full 90° phase differential between the LO ports of the device. Each LO port of the device also requires an equal level of drive from the Oscillator. (see Fig.5).

Gyrator Filters

The on chip filters include an adjustable gyrator filter. This may be adjusted with the use of an additional resistor between pin 4 and GND. This allows flexibility of filter characterstics and also allows for compensation for possible process variations.

Audio AGC

The Audio AGC fundamentally consists of a current sink which is controlled by the audio (baseband data) signal. It has three parameters that may be controlled by the user. These are the Attack (turn on) time, Decay (duration) time and Threshold level (see Fig.6 and 7). See Application note for details.

Regulator

The on chip regulator must be used in conjunction with a suitable PNP transistor to achieve regulation. As the transistor forms part of the regulator feedback loop the transistor should exhibit the following characteristics:-

$$H_{FE}$$
 > = 100 for V_{CE} > = 0.1V

Pin Number	Pin Name	Pin Description
1	TPX	X channel pre-gyrator filter test-point. This can be used for input and output
2	MIX-DEC	Mixer bias de-couple pin
3	LOY	LO input channel Y
4	GYRI	Gyrator current adjust pin
5	LOX	LO input channel X
6	VR	VREF 1.0 V internal signal ground
7	TPY	Y channel pre-gyrator filter test point, input or output
8	GTHADJ	Audio AGC gain and threshold adjust. RSSI signal indicator
9	TCADJ	Audio AGC time constant adjust
10	BEC	Battery economy control
11	BATTFL	Battery flag output
12	TPLIMY	Y channel limiter (post gyrator filter) test point, output only
13	VCC2	Supply connection
14	DATAOP	Data output pin
15	TPLIMX	X channel limiter (post gyrator filter) test point, output only
16	BRF2	Bit rate filter 2, input to data output stage
17	BRF1	Bit rate filter 1, output from detector
18	DIG GND	Digital ground
19	VBG	Bandgap voltage output
20	VBATT	Battery flag input voltage
21	VCC1	Supply connection
22	REGCNT	1V regulator control external PNP drive
23	VREG	1V regulator output voltage
24	MIXB	Mixer input B
25	GND	Ground
26	MIXA	Mixer input A
27	IRFAMP	Current source for external LNA. Value of current output will decrease at high mixer input signal levels due to RF AGC
28	IAGCOUT	Audio AGC output current

Notes

- 1. The values of R13 is determined by the set-up procedure. See Application Note.
- The value of C9 is determined by the output data rate. Use 2nF for 512bps, 1nF for 1200bps and 470pF for 2400bps.
- L2 is used in the Audio AGC circuit (see Fig. 6). For the characteristics of the Audio AGC current source see Fig.7. If the audio AGC is not required then the current source (Pin 28) may be disabled by connecting Pin 9 (TCADJ) to VR (Pin 6) and by connecting Pin 28 (IAGCOUT) to Vcc1, (R18). The voltage at Pin 8 may still be used as an RSSI. R9, C8, C14, C19, R17 and D1 may then be omitted. See Fig.6 for AGC component values.
- 4. L1and C26 form the low noise matching network for the RF amplifier. The values given are for the RF amplifier specified in the Applications Circuit with no Audio AGC connected. i.e. R17 and D1 omitted.
- 5. Suggested diode for use with the Audio AGC circuit (see Fig.6) (D1 is not included on the general demonstration circuit).
- The value of R11 is dependent on the data output load. R11 should allow sufficient current to drive the data output load.

- 5. L1and C26 form the low noise matching network for the RF amplifier. The values given are for the RF amplifier specified in the Applications Circuit with no Audio AGC connected. i.e. R17 and D1 omitted.
- 6. Suggested diode for use with the Audio AGC circuit (D1 is not included on the general demonstration circuit).
- 7. The value of R11 is dependent on the data output load. R11 should allow sufficient current to drive the data output load.

Fig.4 RF amplifier

RF Amplifier Components Values

Resistors	•	Capacitors		
R14, R15	4k7	C13, C15	1nF	Active components
R13	see note 1	C16, C17	1nF	D1 MA862 (Panasonic)
R22	47k	C20, C21	1nF see note 2	
		C24, C25	1nF	
		L2	820nH	

Notes:

(1) The value of R13 is determined by the set up procedure (See "Set up for optimum performance").

(2) C20 and C21 are purely for deomonstration purposes. Pin 24 and Pin 26 may be DC coupled provided that no DC voltage is applied to the mixer inputs.

Frequency Dependent Components

•		'153MHz '	280MHz	450MHz
C26		not used	6.8p	not used
C27		not used	not used	not used
L1		150nH	68nH	39nH
C34		3p3	2p2	1p5
T1		100nH	30nH	16nH
		Coilcraft N2261-A	Coilcraft M1686-A	Coilcraft Q4123-A
VC1		1-10pF	1-10pF	1-3pF
Q4, Q5		Toshiba 2SC5065	Toshiba 2SC5065	Philips BFT25A
(See also L	o drive	e Network)
