- When using the products covered herein, please observe the conditions written herein and the precautions outlined in the following paragraphs. In no event shall the company be liable for any damages resulting from failure to strictly adhere to these conditions and precautions.
 - (1) The products covered herein are designed and manufactured for the following application areas. When using the products covered herein for the equipment listed in Paragraph (2), even for the following application areas, be sure to observe the precautions given in Paragraph (2). Never use the products for the equipment listed in Paragraph (3).
 - Office electronics
 - Instrumentation and measuring equipment
 - Machine tools
 - Audiovisual equipment
 - Home appliance
 - Communication equipment other than for trunk lines
 - (2) Those contemplating using the products covered herein for the following equipment which demands high reliability, should first contact a sales representative of the company and then accept responsibility for incorporating into the design fail-safe operation, redundancy, and other appropriate measures for ensuring reliability and safety of the equipment and the overall system.
 - Control and safety devices for airplanes, trains, automobiles, and other transportation equipment
 - Mainframe computers
 - Traffic control systems
 - · Gas leak detectors and automatic cutoff devices
 - Rescue and security equipment
 - Other safety devices and safety equipment, etc.
 - (3) Do not use the products covered herein for the following equipment which demands extremely high performance in terms of functionality, reliability, or accuracy.
 - Aerospace equipment
 - Communications equipment for trunk lines
 - Control equipment for the nuclear power industry
 - Medical equipment related to life support, etc.
 - (4) Please direct all queries and comments regarding the interpretation of the above three Paragraphs to a sales representative of the company.
- Please direct all queries regarding the products covered herein to a sales representative of the company.

The product, which is 4-Plane Page Mode Dual Work (Simultaneous Read while Erase/Program) Flash memory, is a low power, high density, low cost, nonvolatile read/write storage solution for a wide range of applications. The product can operate at V_{CC} =2.7V-3.6V and V_{PP} =1.65V-3.6V or 11.7V-12.3V. Its low voltage operation capability greatly extends battery life for portable applications.

The product provides high performance asynchronous page mode. It allows code execution directly from Flash, thus eliminating time consuming wait states. Furthermore, its newly configurative partitioning architecture allows flexible dual work operation.

The memory array block architecture utilizes Enhanced Data Protection features, and provides separate Parameter and Main Blocks that provide maximum flexibility for safe nonvolatile code and data storage.

Fast program capability is provided through the use of high speed Page Buffer Program.

Special OTP (One Time Program) block provides an area to store permanent code such as a unique number.

Table 1. Pin Descriptions

Symbol	Type	Name and Function
A ₀ -A ₂₁	INPUT	ADDRESS INPUTS: Inputs for addresses. 64M: A ₀ -A ₂₁
DQ ₀ -DQ ₁₅	INPUT/ OUTPUT	DATA INPUTS/OUTPUTS: Inputs data and commands during CUI (Command User Interface) write cycles, outputs data during memory array, status register, query code, identifier code and partition configuration register code reads. Data pins float to high-impedance (High Z) when the chip or outputs are deselected. Data is internally latched during an erase or program cycle.
CE#	INPUT	CHIP ENABLE: Activates the device's control logic, input buffers, decoders and sense amplifiers. CE#-high (V_{IH}) deselects the device and reduces power consumption to standby levels.
RST#	INPUT	RESET: When low (V_{IL}) , RST# resets internal automation and inhibits write operations which provides data protection. RST#-high (V_{IH}) enables normal operation. After power-up or reset mode, the device is automatically set to read array mode. RST# must be low during power-up/down.
OE#	INPUT	OUTPUT ENABLE: Gates the device's outputs during a read cycle.
WE#	INPUT	WRITE ENABLE: Controls writes to the CUI and array blocks. Addresses and data are latched on the rising edge of CE# or WE# (whichever goes high first).
WP#	INPUT	WRITE PROTECT: When WP# is V_{IL} , locked-down blocks cannot be unlocked. Erase or program operation can be executed to the blocks which are not locked and not locked-down. When WP# is V_{IH} , lock-down is disabled.
$ m V_{PP}$	INPUT	MONITORING POWER SUPPLY VOLTAGE: V_{PP} is not used for power supply pin. With $V_{PP} \le V_{PPLK}$, block erase, full chip erase, (page buffer) program or OTP program cannot be executed and should not be attempted. Applying $12V\pm0.3V$ to V_{PP} provides fast erasing or fast programming mode. In this mode, V_{PP} is power supply pin. Applying $12V\pm0.3V$ to V_{PP} during erase/program can only be done for a maximum of 1,000 cycles on each block. V_{PP} may be connected to $12V\pm0.3V$ for a total of 80 hours maximum. Use of this pin at 12V beyond these limits may reduce block cycling capability or cause permanent damage.
V_{CC}	SUPPLY	DEVICE POWER SUPPLY (2.7V-3.6V): With $V_{CC} \le V_{LKO}$, all write attempts to the flash memory are inhibited. Device operations at invalid V_{CC} voltage (see DC Characteristics) produce spurious results and should not be attempted.
V _{CCQ}	SUPPLY	INPUT/OUTPUT POWER SUPPLY (2.7V-3.6V): Power supply for all input/output pins.
GND	SUPPLY	GROUND: Do not float any ground pins.

NOTES:

"X" denotes the operation available.
 Configurative Partition Dual Work Restrictions:
 Status register reflects partition state, not WSM (Write State Machine) state - this allows a status register for each partition. Only one partition can be erased or programmed at a time - no command queuing.
 Commands must be written to an address within the block targeted by that command.

NOTES:

- 1. The address A_{21} - A_{16} are shown in below table for reading the manufacturer code, device code, device configuration code and OTP data.
- 2. Bottom parameter device has its parameter blocks in the plane0 (The lowest address).
- 3. Block Address = The beginning location of a block address within the partition to which the Read Identifier Codes/OTP command (90H) has been written. DQ₁₅-DQ₂ are reserved for future implementation.
- 4. PCRC=Partition Configuration Register Code.
- 5. OTP-LK=OTP Block Lock configuration.
- 6. OTP=OTP Block data.

1	0	1	00H or 10H or 30H
1	1	1	00H or 10H or 20H or 30H

- 1. The address to read the identifier codes or OTP data is dependent on the partition which is selected when writing the Read Identifier Codes/OTP command (90H).
- 2. Refer to Table 12 for the partition configuration register.

- Refer to DC Characteristics. When V_{PP}≤V_{PPLK}, memory contents can be read, but cannot be altered.
 X can be V_{IL} or V_{IH} for control pins and addresses, and V_{PPLK} or V_{PPH1/2} for V_{PP} See DC Characteristics for V_{PPLK} and V_{PPH1/2} voltages.
 RST# at GND±0.2V ensures the lowest power consumption.
- 4. Command writes involving block erase, full chip erase, (page buffer) program or OTP program are reliably executed when V_{PP}=V_{PPH1/2} and V_{CC}=2.7V-3.6V.

 5. Refer to Table 6 for valid D_{IN} during a write operation.

 6. Never hold OE# low and WE# low at the same timing.

- 7. Refer to Appendix of LH28F640BF series for more information about query code.

- 1. Bus operations are defined in Table 5.
- 2. All addresses which are written at the first bus cycle should be the same as the addresses which are written at the second bus cycle.
 - X=Any valid address within the device.
 - PA=Address within the selected partition.
 - IA=Identifier codes address (See Table 3 and Table 4).
 - QA=Query codes address. Refer to Appendix of LH28F640BF series for details.
 - BA=Address within the block being erased, set/cleared block lock bit or set block lock-down bit.
 - WA=Address of memory location for the Program command or the first address for the Page Buffer Program command.
 - OA=Address of OTP block to be read or programmed (See Figure 3).
 - PCRC=Partition configuration register code presented on the address A₀-A₁₅.
- 3. ID=Data read from identifier codes. (See Table 3 and Table 4).
 - QD=Data read from query database. Refer to Appendix of LH28F640BF series for details.
 - SRD=Data read from status register. See Table 10 and Table 11 for a description of the status register bits.
 - WD=Data to be programmed at location WA. Data is latched on the rising edge of WE# or CE# (whichever goes high first) during command write cycles.
 - OD=Data within OTP block. Data is latched on the rising edge of WE# or CE# (whichever goes high first) during command write cycles.
 - N-1=N is the number of the words to be loaded into a page buffer.
- 4. Following the Read Identifier Codes/OTP command, read operations access manufacturer code, device code, block lock configuration code, partition configuration register code and the data within OTP block (See Table 3 and Table 4).
 - The Read Query command is available for reading CFI (Common Flash Interface) information.
- 5. Block erase, full chip erase or (page buffer) program cannot be executed when the selected block is locked. Unlocked block can be erased or programmed when RST# is V_{IH} .
- 6. Either 40H or 10H are recognized by the CUI (Command User Interface) as the program setup.
- 7. Following the third bus cycle, input the program sequential address and write data of "N" times. Finally, input the any valid address within the target block to be programmed and the confirm command (D0H). Refer to Appendix of

LH28F640BF series for details.

- 8. If the program operation in one partition is suspended and the erase operation in other partition is also suspended, the suspended program operation should be resumed first, and then the suspended erase operation should be resumed next.
- 9. Full chip erase and OTP program operations can not be suspended. The OTP Program command can not be accepted while the block erase operation is being suspended.
- 10. Following the Clear Block Lock Bit command, block which is not locked-down is unlocked when WP# is VIL. When WP# is V_{IH}, lock-down bit is disabled and the selected block is unlocked regardless of lock-down configuration.

 11. Commands other than those shown above are reserved by SHARP for future device implementations and should not be

Table 7. Functions of Block Lock⁽⁵⁾ and Block Lock-Down

[101] ⁽³⁾	1	0	1	Locked	No
[110] ⁽⁴⁾	1	1	0	Lock-down Disable	Yes
[111]	1	1	1	Lock-down Disable	No

NOTES:

- 1. DQ_0 =1: a block is locked; DQ_0 =0: a block is unlocked. DQ_1 =1: a block is locked-down; DQ_1 =0: a block is not locked-down.
- 2. Erase and program are general terms, respectively, to express: block erase, full chip erase and (page buffer) program operations.
- 3. At power-up or device reset, all blocks default to locked state and are not locked-down, that is, [001] (WP#=0) or [101] (WP#=1), regardless of the states before power-off or reset operation.
- 4. When WP# is driven to V_{IL} in [110] state, the state changes to [011] and the blocks are automatically locked.
- 5. OTP (One Time Program) block has the lock function which is different from those described above.

Table 8. Block Locking State Transitions upon Command Write⁽⁴⁾

[110]	1	1	0	[111]	No Change	[111] ⁽²⁾	
[111]	1	1	1	No Change	[110]	No Change	

- 1. "Set Lock" means Set Block Lock Bit command, "Clear Lock" means Clear Block Lock Bit command and "Set Lock-down" means Set Block Lock-Down Bit command.
- 2. When the Set Block Lock-Down Bit command is written to the unlocked block (DQ₀=0), the corresponding block is locked-down and automatically locked at the same time.
- 3. "No Change" means that the state remains unchanged after the command written.
- 4. In this state transitions table, assumes that WP# is not changed and fixed V_{IL} or V_{IH} .

Table 9. Block Locking State Transitions upon WP# Transition⁽⁴⁾

- 1. "WP#=0 \rightarrow 1" means that WP# is driven to V_{IH} and "WP#=1 \rightarrow 0" means that WP# is driven to V_{II} .
- 2. State transition from the current state [011] to the next state depends on the previous state.
- 3. When WP# is driven to $V_{\rm IL}$ in [110] state, the state changes to [011] and the blocks are automatically locked.
- 4. In this state transitions table, assumes that lock configuration commands are not written in previous, current and next state.

7	6	5	4	3	2	1	0

SR.15 - SR.8 = RESERVED FOR FUTURE ENHANCEMENTS (R)

NOTES:

SR.7 = WRITE STATE MACHINE STATUS (WSMS)

- 1 = Ready
- 0 = Busy

SR.6 = BLOCK ERASE SUSPEND STATUS (BESS)

- 1 = Block Erase Suspended
- 0 = Block Erase in Progress/Completed

SR.5 = BLOCK ERASE AND FULL CHIP ERASE STATUS (BEFCES)

- 1 = Error in Block Erase or Full Chip Erase
- 0 = Successful Block Erase or Full Chip Erase

SR.4 = (PAGE BUFFER) PROGRAM AND OTP PROGRAM STATUS (PBPOPS)

- 1 = Error in (Page Buffer) Program or OTP Program
- 0 = Successful (Page Buffer) Program or OTP Program

 $SR.3 = V_{PP} STATUS (VPPS)$

- $1 = V_{pp}$ LOW Detect, Operation Abort
- $0 = V_{pp} OK$

SR.2 = (PAGE BUFFER) PROGRAM SUSPEND STATUS (PBPSS)

- 1 = (Page Buffer) Program Suspended
- 0 = (Page Buffer) Program in Progress/Completed

SR.1 = DEVICE PROTECT STATUS (DPS)

- 1 = Erase or Program Attempted on a Locked Block, Operation Abort
- 0 = Unlocked

Status Register indicates the status of the partition, not WSM (Write State Machine). Even if the SR.7 is "1", the WSM may be occupied by the other partition when the device is set to 2, 3 or 4 partitions configuration.

Check SR.7 to determine block erase, full chip erase, (page buffer) program or OTP program completion. SR.6 - SR.1 are invalid while SR.7="0".

If both SR.5 and SR.4 are "1"s after a block erase, full chip erase, (page buffer) program, set/clear block lock bit, set block lock-down bit, set partition configuration register attempt, an improper command sequence was entered.

SR.3 does not provide a continuous indication of V_{PP} level. The WSM interrogates and indicates the V_{PP} level only after Block Erase, Full Chip Erase, (Page Buffer) Program or OTP Program command sequences. SR.3 is not guaranteed to report accurate feedback when $V_{PP} \neq V_{PPH1}$, V_{PPH2} or V_{PPLK} .

SR.1 does not provide a continuous indication of block lock bit. The WSM interrogates the block lock bit only after Block Erase, Full Chip Erase, (Page Buffer) Program or OTP Program command sequences. It informs the system, depending on the attempted operation, if the block lock bit is set. Reading the block lock configuration codes after writing the Read Identifier Codes/OTP command indicates block lock bit status.

SR.15 - SR.8 and SR.0 are reserved for future use and should be masked out when polling the status register.

SR.0 = RESERVED FOR FUTURE ENHANCEMENTS (R)

NOTES:

After issue a Page Buffer Program command (E8H), XSR.7="1" indicates that the entered command is accepted. If XSR.7 is "0", the command is not accepted and a next Page Buffer Program command (E8H) should be issued again to check if page buffer is available or not.

XSR.15-8 and XSR.6-0 are reserved for future use and should be masked out when polling the extended status register.

*WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.

NOTES:

- 1. Operating temperature is for extended temperature product defined by this specification.
- 2. All specified voltages are with respect to GND. Minimum DC voltage is -0.5V on input/output pins and -0.2V on V_{CC} and V_{PP} pins. During transitions, this level may undershoot to -2.0V for periods <20ns. Maximum DC voltage on input/output pins is V_{CC} +0.5V which, during transitions, may overshoot to V_{CC} +2.0V for periods <20ns.
- 3. Maximum DC voltage on V_{PP} may overshoot to +13.0V for periods <20ns.
- 4. V_{PP} erase/program voltage is normally 2.7V-3.6V. Applying 11.7V-12.3V to V_{PP} during erase/program can be done for a maximum of 1,000 cycles on the main blocks and 1,000 cycles on the parameter blocks. V_{PP} may be connected to 11.7V-12.3V for a total of 80 hours maximum.
- 5. Output shorted for no more than one second. No more than one output shorted at a time.

- 1. All currents are in RMS unless otherwise noted. Typical values are the reference values at V_{CC} =3.0V and T_A =+25°C unless V_{CC} is specified.
- 2. I_{CCWS} and I_{CCES} are specified with the device de-selected. If read or (page buffer) program is executed while in block erase suspend mode, the device's current draw is the sum of I_{CCES} and I_{CCR} or I_{CCW} . If read is executed while in (page buffer) program suspend mode, the device's current draw is the sum of I_{CCWS} and I_{CCR} .
- buffer) program suspend mode, the device's current draw is the sum of I_{CCWS} and I_{CCR}.

 3. Block erase, full chip erase, (page buffer) program and OTP program are inhibited when V_{PP}≤V_{PPLK}, and not guaranteed in the range between V_{PPLK}(max.) and V_{PPH1}(min.), between V_{PPH1}(max.) and V_{PPH2}(min.) and above V_{PPH2}(max.).
- 4. The Automatic Power Savings (APS) feature automatically places the device in power save mode after read cycle completion. Standard address access timings (t_{AVOV}) provide new data when addresses are changed.
- 5. Sampled, not 100% tested.
- 6. V_{PP} is not used for power supply pin. With V_{PP}≤V_{PPLK}, block erase, full chip erase, (page buffer) program and OTP program cannot be executed and should not be attempted.
 - Applying $12V\pm0.3V$ to V_{PP} provides fast erasing or fast programming mode. In this mode, V_{PP} is power supply pin and supplies the memory cell current for block erasing and (page buffer) programming. Use similar power supply trace widths and layout considerations given to the V_{CC} power bus.
 - Applying $12V\pm0.3V$ to V_{PP} during erase/program can only be done for a maximum of 1,000 cycles on each block. V_{PP} may be connected to $12V\pm0.3V$ for a total of 80 hours maximum.
- 7. The operating current in dual work is the sum of the operating current (read, erase, program) in each plane.

- 1. See AC input/output reference waveform for timing measurements and maximum allowable input slew rate.
- 2. Sampled, not 100% tested.

- Sampled, not 100% tested.
 OE# may be delayed up to t_{ELQV}—t_{GLQV} after the falling edge of CE# without impact to t_{ELQV}.
 Address setup time (t_{AVEL}, t_{AVGL}) is defined from the falling edge of CE# or OE# (whichever goes low last).
 Address hold time (t_{ELAX}, t_{GLAX}) is defined from the falling edge of CE# or OE# (whichever goes low last).
 Specifications t_{AVEL}, t_{AVGL}, t_{ELAX}, t_{GLAX} and t_{EHEL}, t_{GHGL} for read operations apply to only status register read operations.

t _{WHR0} (t _{EHR0})	WE# (CE#) High to SR.7 Going "0"	3, 7		t _{AVQV} + 50	ns

- 1. The timing characteristics for reading the status register during block erase, full chip erase, (page buffer) program and OTP program operations are the same as during read-only operations. Refer to AC Characteristics for read-only operations.
- 2. A write operation can be initiated and terminated with either CE# or WE#.
- 3. Sampled, not 100% tested.
- 4. Write pulse width (t_{WP}) is defined from the falling edge of CE# or WE# (whichever goes low last) to the rising edge of CE# or WE# (whichever goes high first). Hence, t_{WP}=t_{WLWH}=t_{ELEH}=t_{WLEH}=t_{ELWH}.

 5. Write pulse width high (t_{WPH}) is defined from the rising edge of CE# or WE# (whichever goes high first) to the falling
- edge of CE# or WE# (whichever goes low last). Hence, t_{WPH}=t_{WHWL}=t_{EHEL}=t_{WHEL}=t_{EHWL}.

 6. V_{PP} should be held at V_{PP}=V_{PPH1/2} until determination of block erase, full chip erase, (page buffer) program or OTP program success (SR.1/3/4/5=0).
- 7. t_{WHR0} (t_{EHR0}) after the Read Query or Read Identifier Codes/OTP command=t_{AVQV}+100ns. 8. Refer to Table 6 for valid address and data for block erase, full chip erase, (page buffer) program, OTP program or lock bit configuration.

1.2.6 Reset Operations

Figure 11. AC Waveform for Reset Operations

Reset AC Specifications (V_{CC} =2.7V-3.6V, T_A =-40°C to +85°C)

Symbol	Parameter	Notes	Min.	Max.	Unit

t_{PLRH}	RST# Low to Reset during Erase or Program	1, 3, 4		22	μs
t _{2VPH}	V _{CC} 2.7V to RST# High	1, 3, 5	100		ns
t_{VHQV}	V _{CC} 2.7V to Output Delay	3		1	ms

- 1. A reset time, t_{PHQV}, is required from the later of SR.7 going "1" or RST# going high until outputs are valid. Refer to AC Characteristics Read-Only Operations for t_{PHQV}.
- 2. t_{PLPH} is <100ns the device may still reset but this is not guaranteed.
- 3. Sampled, not 100% tested.
- 4. If RST# asserted while a block erase, full chip erase, (page buffer) program or OTP program operation is not executing, the reset will complete within 100ns.
- 5. When the device power-up, holding RST# low minimum 100ns is required after V_{CC} has been in predefined range and also has been in stable there.

- 1. Typical values measured at V_{CC} =3.0V, V_{PP} =3.0V or 12V, and T_A =+25°C. Assumes corresponding lock bits are not set. Subject to change based on device characterization.
- 2. Excludes external system-level overhead.
- 3. Sampled, but not 100% tested.
- 4. A latency time is required from writing suspend command (WE# or CE# going high) until SR.7 going "1".
- 5. If the interval time from a Block Erase Resume command to a subsequent Block Erase Suspend command is shorter than t_{ERES} and its sequence is repeated, the block erase operation may not be finished.

A-1 RECOMMENDED OPERATING CONDITIONS

A-1.1 At Device Power-Up

AC timing illustrated in Figure A-1 is recommended for the supply voltages and the control signals at device power-up. If the timing in the figure is ignored, the device may not operate correctly.

*1 To prevent the unwanted writes, system designers should consider the design, which applies V_{CCW} (V_{PP}) to 0V during read operations and $V_{CCWH1/2}$ ($V_{PPH1/2}$) during write or erase operations. See the application note AP-007-SW-E for details.

Figure A-1. AC Timing at Device Power-Up

For the AC specifications t_{VR} , t_R , t_F in the figure, refer to the next page. See the "ELECTRICAL SPECIFICATIONS" described in specifications for the supply voltage range, the operating temperature and the AC specifications not shown in the next page.

A-1.1.1 Rise and Fall Time

Symbol	Parameter	Notes	Min.	Max.	Unit
t _{VR}	V _{CC} Rise Time	1	0.5	30000	μs/V
t _R	Input Signal Rise Time	1, 2		1	μs/V
t _F	Input Signal Fall Time	1, 2		1	μs/V

- 1. Sampled, not 100% tested.
- 2. This specification is applied for not only the device power-up but also the normal operations.

A-1.2 Glitch Noises

Do not input the glitch noises which are below V_{IH} (Min.) or above V_{IL} (Max.) on address, data, reset, and control signals, as shown in Figure A-2 (b). The acceptable glitch noises are illustrated in Figure A-2 (a).

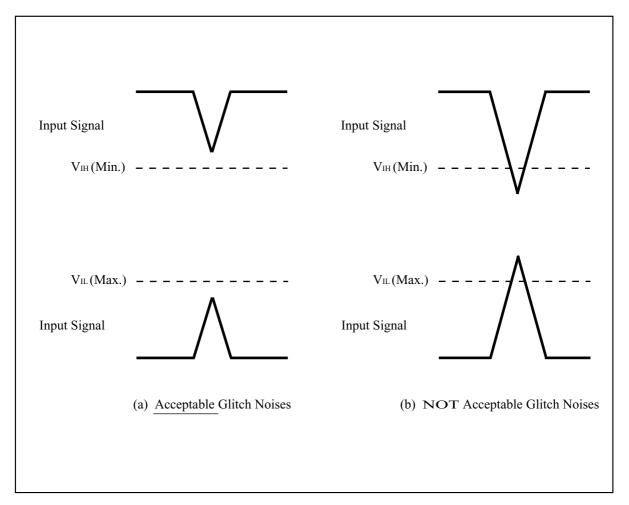

Figure A-2. Waveform for Glitch Noises

A-3 STATUS REGISTER READ OPERATIONS

If AC timing for reading the status register described in specifications is not satisfied, a system processor can check the status register bit SR.15 instead of SR.7 to determine when the erase or program operation has been completed.

Table A-3-1. Status Register Definition (SR.15 and SR.7)

$SR.15 = WRITE STATE MACHINE STATUS: (DQ_{15})$

- 1 = Ready in All Partitions
- 0 = Busy in Any Partition

SR.7 = WRITE STATE MACHINE STATUS FOR EACH PARTITION: (DQ₇)

- 1 = Ready in the Addressed Partition
- 0 = Busy in the Addressed Partition

NOTES:

SR.15 indicates the status of WSM (Write State Machine). If SR.15="0", erase or program operation is in progress in any partition.

SR.7 indicates the status of the partition. If SR.7="0", erase or program operation is in progress in the addressed partition. Even if the SR.7 is "1", the WSM may be occupied by the other partition.

Figure A-3-1. Example of Checking the Status Register (In this example, the device contains four partitions.)
