

DESCRIPTION

The HY514400 is the new generation dynamic RAM organized 1,048,576 words by 4 bits. The HY514400 utilizes HYUNDAI's CMOS process technology as well as advanced circuit techniques to provide wide operating margins. Multiplexed address inputs permit the HY514400 to be packaged in a standard 20/26 pin plastic SOJ and TSOP.

The package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. System oriented feature include single power supply of $5V \pm 10\%$ tolerance, direct interfacing capability with high performance logic families such as Schottky TTL.

FEATURES

- Low power dissipation
 - Operating Current, 100ns : 85mA(max.)
 - TTL Standby Current : 2mA(max.)
 - CMOS Standby Current : 1mA(max.)
- Read-Modify-Write Capability
- \overline{RAS} -only, Hidden, \overline{CAS} -Before- \overline{RAS} Refresh Capability
- Common I/O capability
- Fast Page mode and Test mode capability
- 1024 refresh cycles/16 ms
- High reliability 300 mil 20/26 pin SOJ and 20/26 pin TSOP
- Fast access time and cycle time (ns)

NOTES :

1. An initial pause of 200 μ s is required after power-up followed by 8 $\overline{\text{RAS}}$ cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ initialization cycles instead of 8 $\overline{\text{RAS}}$ cycles are required.
2. AC measurements assume $t_T=5$ ns.
3. $V_{IH}(\text{min.})$ and $V_{IL}(\text{max.})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
4. Measured with a load equivalent to 2 TTL loads and 100pF.
5. $t_{OFF}(\text{max.})$ and t_{OEZ} defines the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.
6. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
7. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in read-modify-write cycles.
8. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristic only. If $t_{WCS} \geq t_{WCS}(\text{min.})$ the cycle is an early write cycle and data out pin will remain open circuit (high impedance) through the entire cycle : If $t_{RWD} \geq t_{RWD}(\text{min.})$, $t_{CWD} \geq t_{CWD}(\text{min.})$ and $t_{AWD} \geq t_{AWD}(\text{min.})$ the cycle is a read-modify-write cycle and data out will contain data read from the selected cell : If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
9. Operation within the $t_{RCD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RCD}(\text{max.})$ is specified as a reference point only : If t_{RCD} is greater than the specified $t_{RCD}(\text{max.})$ limit, then access time is controlled by t_{CAC} .
10. Operation within the $t_{RAD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RAD}(\text{max.})$ is specified as a reference point only : If t_{RAD} is greater than the specified $t_{RAD}(\text{max.})$ limit, then access time is controlled by t_{AA} .
11. These specifications are applied to the test mode.

TEST MODE

The HY514400 is a DRAM organized 1,048,576 words by 4 bits, it is internally organized 524,288 words by 8 bits. In Test Mode, data are written into 8 sectors in parallel and recieved the same way. A_{OC} is not used. If, upon reading, two bits on one I/O are equal (all 1's or 0's), the I/O pin indicates 1.

If they were not equal, the I/O pin would in-

dicate 0. Fig. 1 shows the block diagram of HY514400. In Test Mode, the 1M×4 DRAM can be tested as if it were a 512K×8 DRAM.

\overline{WE} , \overline{CAS} -Before- \overline{RAS} Cycle (Test Mode in Cycle) puts it back into Normal Mode. The Test Mode function reduces test times (1/2 in case of N test pattern).
