CS3845B

Current Mode PWM Control Circuit with 50% Max Duty Cycle

Description

The CS3845B provides all the necessary features to implement off-line fixed frequency current-mode control with a minimum number of external components.

The CS3845B incorporates a precision temperature-controlled oscillator to minimize variations in frequency. An internal toggle flip-flop, which blanks the output off every other clock cycle, ensures that the duty-cycle never exceeds 50%. The undervoltage lock-out feature ensures that V_{REF} is stabilized within specification before the output stage is enabled. **The CS3845B has been optimized for lower start up current (500μA max).**

Other features include 1% trimmed band gap reference, pulse-by-pulse current limiting, and a high-current totem pole output for driving capacitive loads.
Features

- **Optimized for Off-line Use**
- **Temperature Compensated Oscillator**
- **50% Maximum Duty-cycle Clamp**
- **Low Start-up Current (500μA max)**
- **Pulse-by-pulse Current Limiting**
- **Undervoltage Active Pull Down**
- **Double Pulse Suppression**
- **1% Trimmed Bandgap Reference**
- **High Current Totem Pole Output**
Absolute Maximum Ratings

Supply Voltage (I_{CC}<30mA) ....Self Limiting
Supply Voltage (Low Impedance Source)..30V
Output Current..±1A
Output Energy (Capacitive Load) 5μJ
Analog Inputs (V_{FB}, V_{SENSE}) ....−0.3V to 5.5V
Error Amp Output Sink Current...10mA
Lead Temperature Soldering
    Wave Solder (through hole styles only) ....10 sec. max, 260°C peak
   Reflow (SMD styles only) ....60 sec. max above 183°C, 230°C peak

Electrical Characteristics: continued

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNITS
■ **Total Standby Current**					
Start-Up Current			300	500	µA
Operating Supply Current	$V_{FB} = V_{Sense} = 0V$ $R_T = 10k\Omega$, $C_T = 3.3nF$		11	17	mA
V_{CC} Zener Voltage	$I_{CC}=25mA$		34		V
■ **PWM Section**					
Maximum Duty Cycle		46	48	50	%
Minimum Duty Cycle				0	%
■ **Under-Voltage Lockout Section**					
Start Threshold		7.8	8.4	9.0	V
Min. Operating Voltage	After Turn On	7.0	7.6	8.2	V

Notes:
1. These parameters, although guaranteed, are not 100% tested in production.
2. Parameter measured at trip point of latch with $V_{FB}=0$
3. Gain defined as: $A = \dfrac{\Delta V_{COMP}}{\Delta V_{Sense}}$; $0 \leq V_{Sense} \leq 0.8V$.

Package Pin Description

8L PDIP & SO	14L SO	PIN SYMBOL	FUNCTION
1	1	COMP	Error amp output, used to compensate error amplifier
2	3	V_{FB}	Error amp inverting input
3	5	Sense	Noninverting input in Current Sense Comparator
4	7	OSC	Oscillator timing network with Capacitor to Gnd, resistor to V_{REF}
5	9	Gnd	Ground
6	10	V_{OUT}	Output drive pin
7	12	V_{CC}	Positive power supply
8	14	V_{REF}	Output of 5V internal reference
	8	Pwr Gnd	Output driver Gnd
	11	V_{CC} Pwr	Output driver positive supply
	2, 4, 6, 13	NC	No Connection

**Test Circuit**
Circuit Description

Figure 1: Startup voltage for CS3845B.

Undervoltage Lockout

During Undervoltage Lockout (Figure 1), the output driver is biased to sink minor amounts of current. The output should be shunted to ground with a resistor to prevent activating the power switch with extraneous leakage currents.

PWM Waveform

To generate the PWM waveform, the control voltage from the error amplifier is compared to a current sense signal which represents the peak output inductor current (Figure 2). An increase in V_{CC} causes the inductor current slope to increase, thus reducing the duty cycle. This is an inherent feed-forward characteristic of current mode control, since the control voltage does not have to change during changes of input supply voltage.

When the power supply sees a sudden large output current increase, the control voltage will increase allowing the duty cycle to momentarily increase. Since the duty cycle tends to exceed the maximum allowed to prevent transformer saturation in some power supplies, the internal oscillator waveform provides the maximum duty cycle clamp as programmed by the selection of OSC components.
4

Figure 2: Timing Diagram

$t_{on} = t_C$
$t_{off} = t_C + 2t_d$

Figure 3: Timing Parameters.

Setting the Oscillator

The parameters T_c and T_d can be determined as follows:

$$t_c = R_T C_T \ln\left(\frac{V_{REF} - V_{lower}}{V_{REF} - V_{upper}}\right)$$

$$t_d = R_T C_T \ln\left(\frac{V_{REF} - I_d R_T - V_{lower}}{V_{REF} - I_d R_T - V_{upper}}\right)$$

Substituting in typical values for the parameters in the above formulas:

$V_{REF} = 5.0V$, $V_{upper} = 2.7V$, $V_{lower} = 1.0V$, $I_d = 8.3mA$, then

$$t_c \approx 0.5534 R_T C_T$$

$$t_d = R_T C_T \ \ln\left(\frac{2.3 - 0.0083\ R_T}{4.0 - 0.0083\ R_T}\right)$$

For better accuracy R_T should be $\geq 10k\Omega$.

Grounding

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to Gnd in a single point ground.

The transistor and $5k\Omega$ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to Sense.
