## GENERAL DESCRIPTION

The SED1565 Series is a series of single-chip dot matrix liquid crystal display drivers that can be connected directly to a microprocessor bus. 8-bit parallel or serial display data sent from the microprocessor is stored in the internal display data RAM and the chip generates a liquid crystal drive signal independent of the microprocessor. Because the chips in the SED1565 Series contain $65 \times 132$ bits of display data RAM and there is a 1 -to- 1 correspondence between the liquid crystal panel pixels and the internal RAM bits, these chips enable displays with a high degree of freedom. The SED1565 Series chips contain 65 common output circuits and 132 segment output circuits, so that a single chip can drive a $65 \times 132$ dot display (capable of displaying 8 columns $\times 4$ rows of a $16 \times 16$ dot kanji font). The SED1567 Series chips contain 33 common output circuits and 132 segment output circuits, so that a single chip can drive $33 \times 132$ dot display (capable of displaying 8 columns $\times 2$ rows of $16 \times 16$ dot kanji fonts). Thanks to the built-in 55 common output circuits and 132 segment output circuits, the SED1568*** is capable of displaying $55 \times 132$ dots ( 11 columns $\times 4$ lines using $11 \times 12$ dots Kanji font) with a single chip. The SED1569 Series chips contain 53 common output circuits and 132 segment output circuits, so that a single chip can drive $53 \times 132$ dot display (capable of displaying 11 columns $\times 4$ rows of $11 \times 12$ dot kanji fonts). Moreover, the capacity of the display can be extended through the use of master/slave structures between chips.
The chips are able to minimize power consumption because no external operating clock is necessary for the display data RAM read/write operation. Furthermore, because each chip is equipped internally with a lowpower liquid crystal driver power supply, resistors for liquid crystal driver power voltage adjustment and a display clock CR oscillator circuit, the SED1565 Series chips can be used to create the lowest power display system with the fewest components for highperformance portable devices.

## FEATURES

- Direct display of RAM data through the display data RAM.
RAM bit data: " 1 " Non-illuminated
" 0 " Illuminated
(during normal display)
- RAM capacity
$65 \times 132=8580$ bits
- Display driver circuits

SED1565***: 65 common output and 132 segment outputs
SED1566***: 49 common output and 132 segment outputs
SED1567***: 33 common outputs and 132 segment outputs
SED1568***: 55 common outputs and 132 segment outputs
SED1569***: 53 common outputs and 132 segment outputs

- High-speed 8-bit MPU interface (The chip can be connected directly to the both the $80 \times 86$ series MPUs and the 68000 series MPUs)
/Serial interfaces are supported.
- Abundant command functions

Display data Read/Write, display ON/OFF, Normal/ Reverse display mode, page address set, display start line set, column address set, status read, display all points ON/OFF, LCD bias set, electronic volume, read/modify/write, segment driver direction select, power saver, static indicator, common output status select, V5 voltage regulation internal resistor ratio set.

- Static drive circuit equipped internally for indicators. (1 system, with variable flashing speed.)
- Low-power liquid crystal display power supply circuit equipped internally.
Booster circuit (with Boost ratios of Double/Triple/ Quad, where the step-up voltage reference power supply can be input externally)
High-accuracy voltage adjustment circuit (Thermal gradient $-0.05 \% /{ }^{\circ} \mathrm{C}$ or $-0.2 \% /{ }^{\circ} \mathrm{C}$ or external input) V5 voltage regulator resistors equipped internally, V 1 to V 4 voltage divider resistors equipped internally, electronic volume function equipped internally, voltage follower.
- CR oscillator circuit equipped internally (external clock can also be input)
- Extremely low power consumption

Operating power when the built-in power supply is used (an example)
SED1565D0B $81 \mu \mathrm{~A}(\mathrm{VDD}-\mathrm{VSS}=\mathrm{VDD}-\mathrm{VSS} 2=$
/SED1565Dbi 3.0 V, Quad voltage, V5 - VDD = 11.0 V )

SED1566D0B $43 \mu \mathrm{~A}(\mathrm{VdD}-\mathrm{VsS}=\mathrm{VDD}-\mathrm{VsS} 2=$ /SED1566Dbb 3.0 V, Triple voltage, V5 - Vdd = 8.0 V )

SED1567D0B $29 \mu \mathrm{~A}(\mathrm{VDD}-\mathrm{VSS}=\mathrm{VDD}-\mathrm{VSS} 2=$ /SED1567Dbb 3.0 V, Triple voltage, V5 - VdD = 8.0 V )

SED1568D0b/SED1568Dbв
/SED1569D0B/SED1569Dbв $46 \mu \mathrm{~A}(\mathrm{VDD}-\mathrm{Vss}=\mathrm{V} D \mathrm{D}-\mathrm{VSS} 2=$ 3.0 V, Triple voltage, $\mathrm{V} 5-\mathrm{VDD}=-$ 8.0 V )

Conditions: When all displays are in white and the normal mode is selected (see page $60 * 12$ for details of the conditions).

- Power supply

Operable on the low 1.8 voltage
Logic power supply VdD $-\mathrm{VSS}=1.8 \mathrm{~V}$ to -5.5 V
Boost reference voltage: VDD - Vss2 $=1.8 \mathrm{~V}$ to -6.0 V
Liquid crystal drive power supply: VDD $-\mathrm{V} 5=-4.5$ V to -16.0 V

- Wide range of operating temperatures: -40 to $85^{\circ} \mathrm{C}$
- CMOS process
- Shipping forms include bare chip and TCP.
- These chips not designed for resistance to light or resistance to radiation.

|  |  | When the SED1565 Series chips are used in master/slave mode, the various CL terminals must be connected. |  |  |  |  |  |  |  |
| FR | I/O | This is the liquid crystal alternating current signal I/O terminal. M/S = "H": Output M/S = "L": Input <br> When the SED1565 Series chip is used in master/slave mode, the various FR terminals must be connected. |  |  |  |  |  |  | 1 |
| $\overline{\text { DOF }}$ | I/O | This is the liquid crystal display blanking control terminal. $\begin{aligned} & \mathrm{M} / \mathrm{S}=\text { " } \mathrm{H} \text { ": Output } \\ & \mathrm{M} / \mathrm{S}=\text { "L": Input } \end{aligned}$ <br> When the SED1565 Series chip is used in master/slave mode, the various DOF terminals must be connected. |  |  |  |  |  |  | 1 |
| FRS | 0 | This is the output terminal for the static drive. <br> This terminal is only enabled when the static indicator display is ON when in master operation mode, and is used in conjunction with the FR terminal. |  |  |  |  |  |  | 1 |
| IRS | 1 | This terminal selects the resistors for the V5 voltage level adjustment. <br> IRS = "H": Use the internal resistors <br> IRS = "L": Do not use the internal resistors. The V5 voltage level is regulated by an external resistive voltage divider attached to the VR terminal. <br> This pin is enabled only when the master operation mode is selected. It is fixed to either " H " or " L " when the slave operation mode is selected. |  |  |  |  |  |  | 1 |
| HPM | 1 | This is the power control terminal for the power supply circuit for liquid crystal drive. <br> HPM = "H": Normal mode <br> HPM = "L": High power mode <br> This pin is enabled only when the master operation mode is selected. It is fixed to either " H " or " "L" when the slave operation mode is selected. |  |  |  |  |  |  | 1 |

## Liquid Crystal Drive Terminals

## Test Terminals

| Pin Name | I/O | Function | No. of <br> Pins |
| :--- | :---: | :--- | :---: |
| TEST0 to 4 <br> TEST7 to 9 | I/O | These are terminals for IC chip testing. <br> They are set to OPEN. | 12 |
| TEST5, 6 | I | These are terminals for IC chip testing. <br> They are set to VDD. | 2 |

Total: 288 pins for the SED1565***.
272 pins for the SED1566***.
256 pins for the SED1567***.

## DESCRIPTION OF FUNCTIONS

## The MPU Interface

## Selecting the Interface Type

With the SED1565 Series chips, data transfers are done through an 8-bit bi-directional data bus (D7 to D0) or
through a serial data input (SI). Through selecting the P/ S terminal polarity to the " H " or " L " it is possible to select either parallel data input or serial data input as shown in Table 1.

Table 1

| P/S | CS1 | CS2 | A0 | RD | WR | C86 | D7 | D6 | D5~D0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| H: Parallel Input | CS1 | CS2 | A0 | RD | WR | C86 | D7 | D6 | D5~D0 |
| L: Serial Input | CS1 | CS2 | A0 | - | - | - | SI | SCL | (HZ) |

## The Parallel Interface

When the parallel interface has been selected ( $\mathrm{P} / \mathrm{S}=$ "H"), then it is possible to connect directly to either an

8080-system MPU or a 6800 Series MPU (as shown in Table 2) by selecting the C86 terminal to either " H " or to "L".

Table 2

| P/S | $\overline{\text { CS1 }}$ | CS2 | A0 | $\overline{\text { RD }}$ | $\overline{\text { WR }}$ | D7~D0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| H: 6800 Series MPU Bus | $\overline{\mathrm{CS1}}$ | CS2 | A0 | E | R/ $\overline{\mathrm{W}}$ | D7~D0 |
| L: 8080 MPU Bus | $\overline{\mathrm{CS1}}$ | CS 2 | A0 | $\overline{\mathrm{RD}}$ | $\overline{\mathrm{WR}}$ | D7~D0 |

Moreover, data bus signals are recognized by a combination of A0, $\overline{\mathrm{RD}}(\mathrm{E}), \overline{\mathrm{WR}}(\mathrm{R} / \mathrm{W})$ signals, as shown in Table 3.

Table 3

| Shared | $\mathbf{6 8 0 0}$ Series | $\mathbf{8 0 8 0}$ Series |  | Function |
| :---: | :---: | :---: | :---: | :--- |
| $\mathbf{A 0}$ | $\mathbf{R} / \overline{\mathbf{W}}$ | $\overline{\mathbf{R D}}$ | $\overline{\mathbf{W R}}$ |  |
| 1 | 1 | 0 | 1 | Reads the display data |
| 1 | 0 | 1 | 0 | Writes the display data |
| 0 | 1 | 0 | 1 | Status read |
| 0 | 0 | 1 | 0 | Write control data (command) |

## The Serial Interface

When the serial interface has been selected ( $\mathrm{P} / \mathrm{S}=$ "L") then when the chip is in active state ( $\overline{\mathrm{CS} 1}=$ "L" and CS2 $=$ "H") the serial data input (SI) and the serial clock input (SCL) can be received. The serial data is read from the serial data input pin in the rising edge of the serial clocks D7, D6 through D0, in this order. This data is converted to 8 bits parallel data in the rising edge of
the eighth serial clock for the processing.
The A0 input is used to determine whether or the serial data input is display data or command data; when $\mathrm{A} 0=$ "H", the data is display data, and when $\mathrm{A} 0=$ "L" then the data is command data. The A0 input is read and used for detection every 8th rising edge of the serial clock after the chip becomes active.
Figure 1 is a serial interface signal chart.

Figure 1

* When the chip is not active, the shift registers and the counter are reset to their initial states.
* Reading is not possible while in serial interface mode.
* Caution is required on the SCL signal when it comes to line-end reflections and external noise. We recommend that operation be rechecked on the actual equipment.

## The Chip Select

The SED1565 Series chips have two chip select terminals: $\overline{\mathrm{CS} 1}$ and CS2. The MPU interface or the serial interface is enabled only when $\overline{\mathrm{CS} 1}=$ "L" and CS2 $=$ "H".
When the chip select is inactive, D0 to D7 enter a high impedance state, and the $\mathrm{A} 0, \overline{\mathrm{RD}}$, and $\overline{\mathrm{WR}}$ inputs are inactive. When the serial interface is selected, the shift register and the counter are reset.

## Accessing the Display Data RAM and the Internal Registers

Data transfer at a higher speed is ensured since the MPU is required to satisfy the cycle time (tcyc) requirement alone in accessing the SED1565 Series. Wait time may not be considered.
And, in the SED1565 Series chips, each time data is sent from the MPU, a type of pipeline process between LSIs
is performed through the bus holder attached to the internal data bus.
For example, when the MPU writes data to the display data RAM, once the data is stored in the bus holder, then it is written to the display data RAM before the next data write cycle. Moreover, when the MPU reads the display data RAM, the first data read cycle (dummy) stores the read data in the bus holder, and then the data is read from the bus holder to the system bus at the next data read cycle.
There is a certain restriction in the read sequence of the display data RAM. Please be advised that data of the specified address is not generated by the read instruction issued immediately after the address setup. This data is generated in data read of the second time. Thus, a dummy read is required whenever the address setup or write cycle operation is conducted.
This relationship is shown in Figure 2.

## The Busy Flag

When the busy flag is " 1 " it indicates that the SED1565 Series chip is running internal processes, and at this time no command aside from a status read will be received. The busy flag is outputted to D7 pin with the
read instruction. If the cycle time ( tCYC ) is maintained, it is not necessary to check for this flag before each command. This makes vast improvements in MPU processing capabilities possible.

Figure 2

## Display Data RAM

## Display Data RAM

The display data RAM is a RAM that stores the dot data for the display. It has a $65(8$ page $\times 8$ bit +1$) \times 132$ bit structure. It is possible to access the desired bit by specifying the page address and the column address. Because, as is shown in Figure 3, the D7 to D0 display data from the MPU corresponds to the liquid crystal display common direction, there are few constraints at
the time of display data transfer when multiple SED1565 series chips are used, thus and display structures can be created easily and with a high degree of freedom.
Moreover, reading from and writing to the display RAM from the MPU side is performed through the I/O buffer, which is an independent operation from signal reading for the liquid crystal driver. Consequently, even if the display data RAM is accessed asynchronously during liquid crystal display, it will not cause adverse effects on the display (such as flickering).

Figure 3

## The Page Address Circuit

As shown in Figure 6-4, page address of the display data RAM is specified through the Page Address Set Command. The page address must be specified again when changing pages to perform access
Page address 8 (D3, D2, D1, D0 $=1,0,0,0$ ) is the page for the RAM region used only by the indicators, and only display data D0 is used.

## The Column Addresses

As is shown in Figure 4, the display data RAM column address is specified by the Column Address Set command. The specified column address is incremented $(+1)$ with each display data read/write command. This allows the MPU display data to be accessed continuously. Moreover, the incrementation of column addresses stops with 83 H . Because the column address is independent of the page address, when moving, for example, from page 0 column 83 H to page 1 column 00 H , it is necessary to respecify both the page address and the column address.
Furthermore, as is shown in Table 4, the ADC command (segment driver direction select command) can be used to reverse the relationship between the display data RAM column address and the segment output. Because of this, the constraints on the IC layout when the LCD module is assembled can be minimized.

Table 4

| SEG | SEGO | SEG 131 |
| :--- | :--- | :--- |
| Output | S |  |
| ADC "0" | $0(\mathrm{H}) \rightarrow$ | Column Address $\rightarrow 83(\mathrm{H})$ |
| (D0) "1" | $83(\mathrm{H}) \leftarrow$ | Column Address $\leftarrow 0(\mathrm{H})$ |

## The Line Address Circuit

The line address circuit, as shown in Table 4, specifies the line address relating to the COM output when the contents of the display data RAM are displayed. Using the display start line address set command, what is normally the top line of the display can be specified (this is the COM0 output when the common output mode is normal, and the COM63 output for SED1565 Series, COM47 output for SED1566 Series and COM31 output for the SED1567 Series when the common output mode is reversed. The display area is a 65 line area for the SED1565 Series, a 49 line are for the SED1566 and a 33 line area for the SED1567 Series from the display start line address.
If the line addresses are changed dynamically using the display start line address set command, screen scrolling, page swapping, etc. can be performed.

Figure 4

## The Display Data Latch Circuit

The display data latch circuit is a latch that temporarily stores the display data that is output to the liquid crystal driver circuit from the display data RAM.
Because the display normal/reverse status, display ON/ OFF status, and display all points ON/OFF commands control only the data within the latch, they do not change the data within the display data RAM itself.

## The Oscillator Circuit

This is a CR-type oscillator that produces the display clock. The oscillator circuit is only enabled when M/S = "H" and CLS = "H".
When CLS = "L" the oscillation stops, and the display clock is input through the CL terminal.

## Display Timing Generator Circuit

The display timing generator circuit generates the timing signal to the line address circuit and the display data latch circuit using the display clock. The display data is latched into the display data latch circuit synchronized with the display clock, and is output to the data driver output terminal. Reading to the display data liquid crystal driver circuits is completely independent of accesses to the display data RAM by the MPU. Consequently, even if the display data RAM is accessed asynchronously during liquid crystal display, there is absolutely no adverse effect (such as flickering) on the display.
Moreover, the display timing generator circuit generates the common timing and the liquid crystal alternating current signal (FR) from the display clock. It generates a drive wave form using a 2 frame alternating current drive method, as is shown in Figure 5, for the liquid crystal drive circuit.

## Two-frame alternating current drive wave form (SED1565***)

Figure 5

When multiple SED1565 Series chips are used, the slave chips must be supplied the display timing signals (FR, CL, DOF) from the master chip[s].
Table 5 shows the status of the FR, CL, and $\overline{\mathrm{DOF}}$ signals.

Table 5

|  | Operating Mode | FR | CL | DOF |
| :--- | :--- | :--- | :--- | :--- |
| Master $(\mathrm{M} / \mathrm{S}=$ " H ") | The internal oscillator circuit is enabled (CLS = "H") | Output | Output | Output |
|  | The internal oscillator circuit is disabled (CLS = "L") | Output | Input | Output |
| Slave $(\mathrm{M} / \mathrm{S}=$ " L ") | The internal oscillator circuit is enabled (CLS = "H") | Input | Input | Input |
|  | The internal oscillator circuit is disabled (CLS = "L") | Input | Input | Input |

## The Common Output Status Select Circuit

In the SED1565 Series chips, the COM output scan direction can be selected by the common output status select command. (See Table 6.) Consequently, the constraints in IC layout at the time of LCD module assembly can be minimized.

Table 6

| Status | COM Scan Direction |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | SED1565*** | SED1566 ${ }^{* * *}$ | SED1567 | SED1568*** | SED1569 $9^{* * *}$ |
| Normal | COM0 $\rightarrow$ COM63 | COM0 $\rightarrow$ COM47 | COM0 $\rightarrow$ COM31 | COM0 $\rightarrow$ COM53 | COM0 $\rightarrow$ COM51 |
| Reverse | COM63 $\rightarrow$ COM0 | COM47 $\rightarrow$ COM0 | COM31 $\rightarrow$ COM0 | COM53 $\rightarrow$ COM0 | COM51 $\rightarrow$ COM0 |

## The Liquid Crystal Driver Circuits

These are a 197-channel (SED1565 Series), a 181channel (SED1566 Series) multiplexers 165-channel (SED1567 Series) and a 185 -channel (SED1569 Series) that generate four voltage levels for driving the liquid crystal. The combination of the display data, the COM scan signal, and the FR signal produces the liquid crystal drive voltage output.
Figure 6 shows examples of the SEG and COM output wave form.

Figure 6

## The Power Supply Circuits

The power supply circuits are low-power consumption power supply circuits that generate the voltage levels required for the liquid crystal drivers. They comprise Booster circuits, voltage regulator circuits, and voltage follower circuits. They are only enabled in master operation.

The power supply circuits can turn the Booster circuits, the voltage regulator circuits, and the voltage follower circuits ON of OFF independently through the use of the Power Control Set command. Consequently, it is possible to make an external power supply and the internal power supply function somewhat in parallel. Table 7 shows the Power Control Set Command 3-bit data control function, and Table 8 shows reference combinations.

Table 7 The Control Details of Each Bit of the Power Control Set Command

| Item | Status |  |
| :--- | :---: | :---: |
|  | "1" | "0" |
| D2 Booster circuit control bit | ON | OFF |
| D1 Voltage regulator circuit (V regulator circuit) control bit | ON | OFF |
| D0 Voltage follower circuit (V/F circuit) control bit | ON | OFF |

Table 8 Reference Combinations

| (2) Only the V regulator circuit and |  |  |  |  |  |  |  |  |
| the V/F circuit are used |  |  |  |  |  |  |  |  |

* The "step-up system terminals" refer CAP1+, CAP1-, CAP2+, CAP2-, and CAP3-.
* While other combinations, not shown above, are also possible, these combinations are not recommended because they have no practical use.

## The Step-up Voltage Circuits

Using the step-up voltage circuits equipped within the SED1565 Series chips it is possible to product a Quad step-up, a Triple step-up, and a Double step-up of the VDD - VSS2 voltage levels.
Quad step-up: Connect capacitor C1 between CAP1+ and CAP1-, between CAP2+ and CAP2-, between CAP1+ and CAP3-, and between VSS2 and Vout, to produce a voltage level in the negative direction at the Vout terminal that is 4 times the voltage level between VdD and Vss2.
Triple step-up: Connect capacitor C1 between CAP1+ and CAP1-, between CAP2+ and CAP2and between Vss2 and Vout, and short between CAP3- and Vout to produce a voltage level in the negative direction at the Vout terminal that is 3 times the voltage difference between VdD and VSs2.

Double step-up: Connect capacitor C1 between CAP1+ and CAP1-, and between VSS2 and Vout, leave CAP2+ open, and short between CAP2-, CAP3- and Vout to produce a voltage in the negative direction at the Vout terminal that is twice the voltage between Vdd and Vss2.
The step-up voltage relationships are shown in Figure 7.

Figure 7

* The VSS2 voltage range must be set so that the Vout terminal voltage does not exceed the absolute maximum rated value.

## The Voltage Regulator Circuit

The step-up voltage generated at Vout outputs the liquid crystal driver voltage V5 through the voltage regulator circuit.
Because the SED1565 Series chips have an internal high-accuracy fixed voltage power supply with a 64level electronic volume function and internal resistors for the V5 voltage regulator, systems can be constructed without having to include high-accuracy voltage regulator circuit components.
Moreover, in the SED1565 Series, three types of thermal gradients have been prepared as VREG options: (1) approximately $-0.05 \% /{ }^{\circ} \mathrm{C}(2)$ approximately $-0.2 \% /{ }^{\circ} \mathrm{C}$, and (3) external input (supplied to the VRS terminal).

## (A) When the $\mathrm{V}_{5}$ Voltage Regulator Internal Resistors Are Used

Through the use of the V5 voltage regulator internal resistors and the electronic volume function the liquid crystal power supply voltage V5 can be controlled by commands alone (without adding any external resistors), making it possible to adjust the liquid crystal display brightness. The V5 voltage can be calculated using equation A-1 over the range where $\mid$ V5 $|<|$ Vout $\mid$.

Figure 8

VREG is the IC-internal fixed voltage supply, and its voltage at $\mathrm{Ta}=25^{\circ} \mathrm{C}$ is as shown in Table 9 .

Table 9

| Equipment Type | Thermal Gradient | Units | VREG | Units |
| :--- | :---: | :---: | :---: | :---: |
| (1) Internal Power Supply | -0.05 | $\left[\% /{ }^{\circ} \mathrm{C}\right]$ | -2.1 | $[\mathrm{~V}]$ |
| (2) Internal Power Supply | -0.2 | $\left[\% /{ }^{\circ} \mathrm{C}\right]$ | -4.9 | $[\mathrm{~V}]$ |
| (3) External Input | - | - | VRS | $[\mathrm{V}]$ |

$\alpha$ is set to 1 level of 64 possible levels by the electronic volume function depending on the data set in the 6 -bit electronic volume register. Table 10 shows the value for $\alpha$ depending on the electronic volume register settings.

Table 10

| D5 | D4 | D3 | D2 | D1 | D0 | $\alpha$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\mathrm{Rb} / \mathrm{Ra}$ is the V 5 voltage regulator internal resistor ratio, and can be set to 8 different levels through the V5 voltage regulator internal resistor ratio set command. The ( $1+\mathrm{Rb} / \mathrm{Ra}$ ) ratio assumes the values shown in Table 11 depending on the 3-bit data settings in the V5 voltage regulator internal resistor ratio register.

V5 voltage regulator internal resistance ratio register value and ( $1+\mathrm{Rb} / \mathrm{Ra}$ ) ratio (Reference value)

The $\mathrm{V}_{5}$ voltage as a function of the $\mathrm{V}_{5}$ voltage regulator internal resistor ratio register and the electronic volume register.

Figure 19: SED1569Dob/SED1569Dbв (Temperature Gradient $=-0.05 \% /{ }^{\circ} \mathrm{C}$ Model
The $\mathrm{V}_{5}$ voltage as a function of the $\mathrm{V}_{5}$ voltage regulator internal resistor ratio register and the electronic volume register.

Setup example: When selecting $\mathrm{Ta}=25^{\circ} \mathrm{C}$ and $\mathrm{V} 5=7$ V for an SED1567 model on which Temperature gradient $=-0.05 \% /{ }^{\circ} \mathrm{C}$.
Using Figure 15 and the equation $\mathrm{A}-1$, the following setup is enabled.

Table 12

| Contents | Register |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D5 | D4 | D3 | D2 | D1 | D0 |
| For V5 voltage <br> regulator <br> Electronic Volume | - | - | - | 0 | 1 | 0 |

At this time, the variable range and the notch width of the V5 voltage is, as shown Table 13, as dependent on the electronic volume.

Table 13

| V5 | Min | Typ | Max | Units |
| :--- | :--- | :--- | :--- | :--- |
| Variable Range | -8.4 (63 levels) | -6.8 (central value) | -5.1 (0 level) | $[\mathrm{V}]$ |
| Notch width |  | 51 | $[\mathrm{mV}]$ |  |

(B) When an External Resistance is Used (i.e., The V5 Voltage Regulator Internal Resistors Are Not Used) (1)
The liquid crystal power supply voltage V5 can also be set without using the V5 voltage regulator internal resistors (IRS terminal $=$ "L") by adding resistors Ra" and Rb ' between VDD and $\mathrm{VR}^{\prime}$, and between VR and V5,
respectively. When this is done, the use of the electronic volume function makes it possible to adjust the brightness of the liquid crystal display by controlling the liquid crystal power supply voltage V5 through commands. In the range where $\left|V_{5}\right|<\mid$ Vout $\mid$, the V5 voltage can be calculated using equation B-1 based on the external resistances Ra ' and Rb '.

Figure 20

Setup example: When selecting $\mathrm{Ta}=25^{\circ} \mathrm{C}$ and $\mathrm{V} 5=-$ 7 V for an SED1567 Series model where the temperature gradient $=-0.05 \% /{ }^{\circ} \mathrm{C}$.
When the central value of the electron volume register is $(D 5, D 4, D 3, D 2, D 1, D 0)=(1,0,0,0,0,0)$, then $\alpha$ $=31$ and VREG $=-2.1 \mathrm{~V}$ so, according to equation $\mathrm{B}-1$,

$$
\begin{aligned}
V_{5} & =\left(1+\frac{R b^{\prime}}{R a^{\prime}}\right) \cdot\left(1-\frac{\alpha}{162}\right) \cdot V_{R E G} \\
-11 V & =\left(1+\frac{R b^{\prime}}{R a^{\prime}}\right) \cdot\left(1-\frac{31}{162}\right) \cdot(-2.1) \text { (Equation B-2) }
\end{aligned}
$$

Consequently, by equations B-2 and B-3,

$$
\begin{aligned}
\frac{R b^{\prime}}{R a^{\prime}} & =3.12 \\
R a^{\prime} & =340 k \Omega \\
R b^{\prime} & =1060 k \Omega
\end{aligned}
$$

At this time, the V5 voltage variable range and notch width, based on the electron volume function, is as given in Table 14.

Moreover, when the value of the current running through Ra' and $\mathrm{Rb}^{\prime}$ is set to $5 \mu \mathrm{~A}$,

$$
R a^{\prime}+R b^{\prime}=1.4 M \Omega \quad \quad(\text { Equation B-3) }
$$

Table 14

| V5 | Min | Typ | Max | Units |
| :--- | :--- | :--- | :--- | :--- |
| Variable Range | -8.6 (63 levels) | -7.0 (central value) | -5.3 (0 level) | [V] |
| Notch width |  | 52 |  | $[\mathrm{mV}]$ |

(C) When External Resistors are Used (i.e. The V5 Voltage Regulator Internal Resistors Are Not Used). (2)
When the external resistor described above are used, adding a variable resistor as well makes it possible to perform fine adjustments on Ra ' and $\mathrm{Rb}^{\prime}$, to set the liquid crystal drive voltage V5. In this case, the use of
the electronic volume function makes it possible to control the liquid crystal power supply voltage V5 by commands to adjust the liquid crystal display brightness. In the range where $\mid$ V5 $|<|$ Vout $\mid$ the V5 voltage can be calculated by equation $\mathrm{C}-1$ below based on the R1 and R 2 (variable resistor) and R3 settings, where R2 can be subjected to fine adjustments ( $\Delta \mathrm{R} 2$ ).

$$
V_{5}=\left(1+\frac{R_{3}+R_{2}-\Delta R_{2}}{R_{1}+\Delta R_{2}}\right) \cdot V_{E V}
$$

$$
=\left(1+\frac{R_{3}+R_{2}-\Delta R_{2}}{R_{1}+\Delta R_{2}}\right) \cdot\left(1-\frac{\alpha}{162}\right) \cdot V_{R E G}
$$

$$
\left[\because V_{E V}=(1-\alpha / 162) \cdot V_{R E G}\right]
$$

(Equation C-1)

Figure 21

Setup example: When selecting $\mathrm{Ta}=25^{\circ} \mathrm{C}$ and $\mathrm{V} 5=-$ 5 to -9 V (using R2) for an SED1567 model where the temperature gradient $=-0.05 \% /{ }^{\circ} \mathrm{C}$.
When the central value for the electronic volume register is set at $(\mathrm{D} 5, \mathrm{D} 4, \mathrm{D} 3, \mathrm{D} 2, \mathrm{D} 1, \mathrm{D} 0)=(1,0,0,0,0,0)$,

$$
\begin{aligned}
\alpha & =31 \\
V_{R E G} & =-2.1 V
\end{aligned}
$$

so, according to equation $\mathrm{C}-1$, when $\Delta \mathrm{R} 2=0 \Omega$, in order to make V5 $=-9 \mathrm{~V}$,

$$
-9 V=\left(1+\frac{R_{3}+R_{2}}{R_{1}}\right) \cdot\left(1-\frac{31}{162}\right) \cdot(-2.1)
$$

(Equation C-2)

When $\Delta \mathrm{R}_{2}=\mathrm{R} 2$, in order to make $\mathrm{V}=-5 \mathrm{~V}$,

$$
-5 V=\left(1+\frac{R_{3}}{R_{1}+R_{2}}\right) \cdot\left(1-\frac{31}{162}\right) \cdot(-2.1)
$$

(Equation C-3)
Moreover, when the current flowing VDD and V5 is set to $5 \mu \mathrm{~A}$,

$$
R_{1}+R_{2}+R_{3}=1.4 M \Omega
$$

(Equation $\mathrm{C}-4$ )
With this, according to equation C-2, C-3 and C-4,

$$
\begin{aligned}
& R_{1}=264 k \Omega \\
& R_{2}=211 k \Omega \\
& R_{3}=925 k \Omega
\end{aligned}
$$

At this time, the V5 voltage variable range and notch width based on the electron volume function is as shown in Table 15.

Table 15

| V5 | Min | Typ | Max | Units |
| :--- | :--- | :--- | :--- | :--- |
| Variable Range | -8.7 (63 levels) | -7.0 (central value) | -5.3 (0 level) | $[\mathrm{V}]$ |
| Notch width |  | 53 |  | $[\mathrm{mV}]$ |

* When the V5 voltage regulator internal resistors or the electronic volume function is used, it is necessary to at least set the voltage regulator circuit and the voltage follower circuit to an operating mode using the power control set commands. Moreover, it is necessary to provide a voltage from Vout when the Booster circuit is OFF.
* The VR terminal is enabled only when the V5 voltage regulator internal resistors are not used (i.e. the IRS terminal $=$ "L"). When the V5 voltage regulator internal resistors are used (i.e. when the IRS terminal $=$ "H"), then the VR terminal is left open.
* Because the input impedance of the VR terminal is high, it is necessary to take into consideration short leads, shield cables, etc. to handle noise.

## The Liquid Crystal Voltage Generator Circuit

The V5 voltage is produced by a resistive voltage divider within the IC, and can be produced at the $\mathrm{V}_{1}, \mathrm{~V}_{2}$, $V_{3}$, and $V_{4}$ voltage levels required for liquid crystal driving. Moreover, when the voltage follower changes the impedance, it provides $\mathrm{V}_{1}, \mathrm{~V}_{2}, \mathrm{~V} 3$ and V 4 to the liquid crystal drive circuit. $1 / 9$ bias or $1 / 7$ bias for SED1565 Series, $1 / 8$ bias or 1/6 bias for SED1566 Series and $1 / 6$ bias or $1 / 5$ bias for the SED1567 Series can be selected.

## High Power Mode

The power supply circuit equipped in the SED1565 Series chips has very low power consumption (normal mode: $\overline{\mathrm{HPM}}=$ "H"). However, for LCDs or panels with large loads, this low-power power supply may cause display quality to degrade. When this occurs, setting the HPM terminal to "L" (high power mode) can improve the quality of the display. We recommend that the display be checked on actual equipment to determine whether or not to use this mode.
Moreover, if the improvement to the display is inadequate even after high power mode has been set, then it is necessary to add a liquid crystal drive power supply externally.

## The Internal Power Supply Shutdown Command Sequence

The sequence shown in Figure 22 is recommended for shutting down the internal power supply, first placing the power supply in power saver mode and then turning the power supply OFF.

Figure 22

## Reference Circuit Examples

Figure 22 shows reference circuit examples.
(1) When used all of the step-up circuit, voltage regulating circuit and V/F circuit
(1) When the voltage regulator internal resistor is used.
(Example where Vss2 $=$ Vss, with $4 x$ step-up)
4 VDD

When the voltage regulator circuit and V/F circuit alone are used
(1) When the $\mathrm{V}_{5}$ voltage regulator internal resistor is not used.

(2) When the voltage regulator internal resistor is not used.
(Example where Vss2 $=$ Vss, with $4 x$ step-up)

(3) When the V/F circuit alone is used

(5) When the built-in power circuit is used to drive a liquid crystal panel heavily loaded with AC or DC, it is recommended to connect an external resistor to stabilize potentials of $\mathrm{V}_{1}, \mathrm{~V}_{2}, \mathrm{~V}_{3}$ and $\mathrm{V}_{4}$ which are output from the built-in voltage follower.

(4) When the built-in power is not used

Examples of shared reference settings When $\mathrm{V}_{5}$ can vary between -8 and 12 V

| Item | Set value | Units |
| :---: | :---: | :---: |
| $\mathrm{C}_{1}$ | 1.0 to 4.7 | $\mu \mathrm{~F}$ |
| $\mathrm{C}_{2}$ | 0.01 to 1.0 | $\mu \mathrm{~F}$ |

Reference set value R4: $100 \mathrm{~K} \Omega \sim 1 \mathrm{M} \Omega$ It is recommended to set an optimum resistance value R4 taking the liquid crystal display and the drive waveform.

Figure 23

* 1 Because the VR terminal input impedance is high, use short leads and shielded lines.
* 2 C 1 and C 2 are determined by the size of the LCD being driven. Select a value that will stabilize the liquid crystal drive voltage.
Example of the Process by which to Determine the Settings:
- Turn the voltage regulator circuit and voltage follower circuit ON and supply a voltage to Vout from the outside.
- Determine C2 by displaying an LCD pattern with a heavy load (such as horizontal stripes) and selecting a C2 that stabilizes the liquid crystal drive voltages (V1 to V5). Note that all C2 capacitors must have the same capacitance value.
- Next turn all the power supplies ON and determine C1.

## The Reset Circuit

When the $\overline{\text { RES }}$ input comes to the "L" level, these LSIs return to the default state. Their default states are as follows:

1. Display OFF
2. Normal display
3. ADC select: Normal (ADC command D0 = "L")
4. Power control register: $(D 2, D 1, D 0)=(0,0,0)$
5. Serial interface internal register data clear
6. LCD power supply bias rate:

$$
\begin{aligned}
& \text { SED1565*** ....................................... } 1 / 9 \text { bias } \\
& \text { SED1566**, } 1568^{* * *}, 1569^{* * *} . . . . .1 / 8 \text { bias } \\

\end{aligned}
$$

7. All-indicator lamps-on OFF (All-indicator lamps ON/OFF command D0 = "L")
8. Power saving clear
9. V5 voltage regulator internal resistors Ra and Rb separation
(In case of SED1565Dbв, SED1566Dbb, SED1567Dbb, SED1568Dbi and SED1569Dbb, internal resistors are connected while $\overline{\mathrm{RES}}$ is "L.")
10. Output conditions of SEG and COM terminals SEG: V2/V3, COM : V1/V4
(In case of SED1565Dbb, SED1566Dbb, SED1567Dbb, SED1568Dbi and SED1569Dbi, both the SEG terminal and the COM terminal output the VDA level while RES is "L." In case of other models, the SEG terminal outputs V2 and the COM terminal outputs V1 while $\overline{\mathrm{RES}}$ is "L.")
11. Read modify write OFF
12. Static indicator OFF Static indicator register : $(\mathrm{D} 1, \mathrm{D} 2)=(0,0)$
13. Display start line set to first line
14. Column address set to Address 0
15. Page address set to Page 0
16. Common output status normal
17. V5 voltage regulator internal resistor ratio set mode clear
18. Electronic volume register set mode clear Electronic volume register : (D5, D4, D3, D2, D1, $\mathrm{D} 0)=(1,0.0,0,0,0)$
19. Test mode clear

On the other hand, when the reset command is used, the above default settings from 11 to 19 are only executed.

When the power is turned on, the IC internal state becomes unstable, and it is necessary to initialize it using the RES terminal. After the initialization, each input terminal should be controlled normally.
Moreover, when the control signal from the MPU is in the high impedance, an overcurrent may flow to the IC. After applying a current, it is necessary to take proper measures to prevent the input terminal from getting into the high impedance state.
If the internal liquid crystal power supply circuit is not used on SED1565Dbb, SED1566Dbb, SED1567Dbb, SED1568Dbi and SED1569Dbb, it is necessary that $\overline{R E S}$ is "H" when the external liquid crystal power supply is turned on. This IC has the function to discharge V5 when RES is "L," and the external power supply short-circuits to VDD when RES is "L."
While RES is "L," the oscillator and the display timing generator stop, and the CL, FR, FRS and $\overline{\mathrm{DOF}}$ terminals are fixed to "H." The terminals D0 to D7 are not affected. The VDD level is output from the SEG and COM output terminals. This means that an internal resistor is connected between VdD and V5.
When the internal liquid crystal power supply circuit is not used on other models of SED1565 series, it is necessary that RE is " $L$ " when the external liquid crystal power supply is turned on.
While RES is "L," the oscillator works but the display timing generator stops, and the CL, FR, FRS and DOF terminals are fixed to "H." The terminals D0 to D7 are not affected.

## COMMANDS

The SED1565 Series chips identify the data bus signals by a combination of A0, $\overline{\mathrm{RD}}(\mathrm{E}), \overline{\mathrm{WR}}(\mathrm{R} / \overline{\mathrm{W}})$ signals. Command interpretation and execution does not depend on the external clock, but rather is performed through internal timing only, and thus the processing is fast enough that normally a busy check is not required.
In the 8080 MPU interface, commands are launched by inputting a low pulse to the $\overline{\mathrm{RD}}$ terminal for reading, and inputting a low pulse to the WR terminal for writing. In the 6800 Series MPU interface, the interface is placed in a read mode when an "H" signal is input to the R/W terminal and placed in a write mode when a " L " signal is input to the R / $\overline{\mathrm{W}}$ terminal and then the command is launched by inputting a high pulse to the E terminal. (See " 10 . Timing Characteristics" regarding the timing.) Consequently, the 6800 Series MPU interface is different than the 80 x 86 Series MPU interface in that in the explanation of commands and the display commands the status read and display data read $\overline{\mathrm{RD}}(\mathrm{E})$ becomes " $1(\mathrm{H})$ ". In the explanations below the commands are explained using the 8080 Series MPU interface as the example.
When the serial interface is selected, the data is input in sequence starting with D7.
<Explanation of Commands>

## Display ON/OFF

This command turns the display ON and OFF.

|  | $\mathbf{E}$ | $\mathbf{R} / \overline{\mathbf{W}}$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A0 | $\mathbf{R D}$ | $\mathbf{W R}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | Setting |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | Display ON <br> Display OFF |

When the display OFF command is executed when in the display all points ON mode, power saver mode is entered. See the section on the power saver for details.

## Display Start Line Set

This command is used to specify the display start line address of the display data RAM shown in Figure 4. For further details see the explanation of this function in "The Line Address Circuit".

|  | $\mathbf{E}$ | $\mathbf{R} / \overline{\mathbf{W}}$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A0 | $\mathbf{R D}$ | $\overline{\mathbf{R R}}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | Line address |
| 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|  |  |  |  |  | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
|  |  |  |  |  |  | 0 | 0 | 0 | 1 | 0 | 2 |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 0 | 1 |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 | 62 |

## Page Address Set

This command specifies the page address corresponding to the low address when the MPU accesses the display data RAM (see Figure 4). Specifying the page address and column address enables to access a desired bit of the display data RAM. Changing the page address does not accompany a change in the status display. See the page address circuit in the Function Description (page 1-20) for the detail.

|  | $\mathbf{E}$ | $\mathbf{R} / \overline{\mathbf{W}}$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A0 | $\mathbf{R D}$ | $\overline{\mathbf{W R}}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | Page address |
| 0 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
|  |  |  |  |  |  |  | 0 | 0 | 0 | 1 | 1 |
|  |  |  |  |  |  |  |  | 0 | 1 | 0 | 2 |
|  |  |  |  |  |  |  | 0 | 1 | 1 | 1 | $\downarrow$ |
|  |  |  |  |  |  |  | 1 | 0 | 0 | 0 | 7 |

## Column Address Set

This command specifies the column address of the display data RAM shown in Figure 4. The column address is split into two sections (the higher 4 bits and the lower 4 bits) when it is set (fundamentally, set continuously). Each time the display data RAM is accessed, the column address automatically increments ( +1 ), making it possible for the MPU to continuously read from/write to the display data. The column address increment is topped at 83 H . This does not change the page address continuously. See the function explanation in "The Column Address Circuit," for details.

|  | A0 | $\frac{E}{R D}$ | $\frac{R / \bar{W}}{\overline{W R}}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | A7 | A6 | A5 | A4 | A3 | A2 | A1 | A0 | Column address |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| High bits Low bits $\rightarrow$ | 0 | 1 | 0 | 0 | 0 | 0 | 1 | A7 | A6 | A5 | A4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|  |  |  |  |  |  |  | 0 | A3 | A2 | A1 | A0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
|  |  |  |  |  |  |  |  |  |  |  |  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 2 |
|  |  |  |  |  |  |  |  |  |  |  |  | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 130 |
|  |  |  |  |  |  |  |  |  |  |  |  | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 131 |

## Status Read

| A0 | $\mathbf{E}$ | $\mathbf{R D} / \overline{\mathbf{W}}$ |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| WR | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |  |  |
| 0 | 0 | 1 | BUSY | ADC | ON/OFF | RESET | 0 | 0 | 0 | 0 |

| BUSY | When BUSY $=1$, it indicates that either processing is occurring internally or a reset condition <br> is in process. While the chip does not accept commands until BUSY $=0$, if the cycle time can <br> be satisfied, there is no need to check for BUSY conditions. |
| :--- | :--- |
| ADC | This shows the relationship between the column address and the segment driver. <br> 0: Reverse (column address 131-n $\leftrightarrow$ SEG $n$ ) <br> 1: Normal (column address $\mathrm{n} \leftrightarrow$ SEG n) <br> (The ADC command switches the polarity.) |
| ON/OFF | ON/OFF: indicates the display ON/OFF state. <br> 0: Display ON <br> 1: Display OFF <br> (This display ON/OFF command switches the polarity.) |
| RESET | This indicates that the chip is in the process of initialization either because of a RES signal or <br> because of a reset command. <br> 0: Operating state <br> 1: Reset in progress |

## Display Data Write

This command writes 8-bit data to the specified display data RAM address. Since the column address is automatically incremented by " 1 " after the write, the MPU can write the display data.

## Display Data Read

This command reads 8-bit data from the specified display data RAM address. Since the column address is automatically incremented by " 1 " after the read, the CPU can continuously read multiple-word data. One dummy read is required immediately after the column address has been set. See the function explanation in "Display Data RAM" for the explanation of accessing the internal registers. When the serial interface is used, reading of the display data becomes unavailable.

|  |  |  | $\frac{\mathrm{R} / \overline{\mathrm{h}}}{\mathrm{~W} R}$ |  | D7 | D6 |  | D5 | D4 | D3 |  | D2 |  |  | D |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 0 | 1 |  |  |  |  |  | ead | D |  |  |  |  |  |

## ADC Select (Segment Driver Direction Select)

This command can reverse the correspondence between the display RAM data column address and the segment driver output. Thus, sequence of the segment driver output pins may be reversed by the command. See the column address circuit (page 1-20) for the detail. Increment of the column address (by " 1 ") accompanying the reading or writing the display data is done according to the column address indicated in Figure 4.

|  | $\mathbf{E}$ | $\mathbf{R} / \mathbf{W}$ |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- | :--- |
| A0 | $\mathbf{R D}$ | $\mathbf{W R}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |  | Setting |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | Normal <br> Reverse |  |

## Display Normal/Reverse

This command can reverse the lit and unlit display without overwriting the contents of the display data RAM. When this is done the display data RAM contents are maintained.

| A |  |  | $\frac{\mathrm{R} / \overline{\mathbf{W}}}{\overline{\mathrm{W}}}$ | D7 | D | 6 | D5 | D4 | D3 | D2 | D1 | D |  | Setting |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  |  | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 1 |  | RAM Data "H" <br> LCD ON voltage (normal) <br> RAM Data "L" <br> LCD ON voltage (reverse) |

## Display All Points ON/OFF

This command makes it possible to force all display points ON regardless of the content of the display data RAM. The contents of the display data RAM are maintained when this is done. This command takes priority over the display normal/reverse command.

| A0 | $\overline{\mathbf{R D}}$ | $\overline{\mathbf{R} / \overline{\mathbf{W}}}$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{W R}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | Setting |  |  |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | Normal display mode |
|  |  |  |  |  |  |  |  |  |  | 1 | Display all points ON |

When the display is in an OFF mode, executing the display all points ON command will place the display in power save mode. For details, see the (20) Power Save section.

## LCD Bias Set

This command selects the voltage bias ratio required for the liquid crystal display.

## Read/Modify/Write

This command is used paired with the "END" command. Once this command has been input, the display data read command does not change the column address, but only the display data write command increments $(+1)$ the column address. This mode is maintained until the END command is input. When the END command is input, the column address returns to the address it was at when the read/modify/write command was entered. This function makes it possible to reduce the load on the MPU when there are repeating data changes in a specified display region, such as when there is a blanking cursor.

* Even in read/modify/write mode, other commands aside from display data read/write commands can also be used. However, the column address set command cannot be used.
- The sequence for cursor display

Figure 24

## End

This command releases the read/modify/write mode, and returns the column address to the address it was at when the mode was entered.

| A0 | $\frac{E}{R D}$ | $\begin{aligned} & \mathrm{R} / \overline{\mathbf{W}} \\ & \overline{W R} \end{aligned}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 |

Figure 25

## Reset

This command initializes the display start line, the column address, the page address, the common output mode, the V5 voltage regulator internal resistor ratio, the electronic volume, and the static indicator are reset, and the read/modify/ write mode and test mode are released. There is no impact on the display data RAM. See the function explanation in "Reset" for details.
The reset operation is performed after the reset command is entered.

|  | $\mathbf{E}$ | $\mathbf{R} / \overline{\mathbf{W}}$ |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A0 | $\mathbf{R D}$ | $\mathbf{W R}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| 0 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 |

The initialization when the power supply is applied must be done through applying a reset signal to the $\overline{\mathrm{RES}}$ terminal. The reset command must not be used instead.

## Common Output Mode Select

This command can select the scan direction of the COM output terminal. For details, see the function explanation in "Common Output Mode Select Circuit."

* Disabled bit

## Power Controller Set

This command sets the power supply circuit functions. See the function explanation in "The Power Supply Circuit," for details

[Translator's Note: the abbreviations explained within these parentheses for V and V/F have been written out in the English translation and are therefore no longer necessary.]

## V5 Voltage Regulator Internal Resistor Ratio Set

This command sets the V5 voltage regulator internal resistor ratio. For details, see the function explanation is "The Power Supply Circuits."

## The Electronic Volume (Double Byte Command)

This command makes it possible to adjust the brightness of the liquid crystal display by controlling the liquid crystal drive voltage V5 through the output from the voltage regulator circuits of the internal liquid crystal power supply. This command is a two byte command used as a pair with the electronic volume mode set command and the electronic volume register set command, and both commands must be issued one after the other.

- The Electronic Volume Mode Set

When this command is input, the electronic volume register set command becomes enabled. Once the electronic volume mode has been set, no other command except for the electronic volume register command can be used. Once the electronic volume register set command has been used to set data into the register, then the electronic volume mode is released.

|  |  | $\bar{E}$ | $\frac{\mathrm{R} / \overline{\mathrm{W}}}{\mathrm{Nr}}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 |  | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |  |  |

## - Electronic Volume Register Set

By using this command to set six bits of data to the electronic volume register, the liquid crystal drive voltage V5 assumes one of the 64 voltage levels.
When this command is input, the electronic volume mode is released after the electronic volume register has been set.

|  | $\mathbf{E} \mathbf{E}$ | $\mathbf{R} / \overline{\mathbf{W}}$ |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | $*$ | $*$ | 0 | 0 | 0 | 0 | 0 | 1 |  |  |
| 0 | 1 | 0 | $*$ | $*$ | 0 | 0 | 0 | 0 | 1 | 0 | S5all |  |
| 0 | 1 | 0 | $*$ | $*$ | 0 | 0 | 0 | 0 | 1 | 1 |  |  |
| 0 | 1 | 0 | $*$ | $*$ |  |  | $\downarrow$ |  |  |  |  |  |
| 0 | 1 | 0 | $*$ | $*$ | 1 | 1 | 1 | 1 | 1 | 0 |  |  |

When the electronic volume function is not used, set this to $(1,0,0,0,0,0)$

- The Electronic Volume Register Set Sequence

Figure 26

## Static Indicator (Double Byte Command)

This command controls the static drive system indicator display. The static indicator display is controlled by this command only, and is independent of other display control commands.
This is used when one of the static indicator liquid crystal drive electrodes is connected to the FR terminal, and the other is connected to the FRS terminal. A different pattern is recommended for the static indicator electrodes than for the dynamic drive electrodes. If the pattern is too close, it can result in deterioration of the liquid crystal and of the electrodes.
The static indicator ON command is a double byte command paired with the static indicator register set command, and thus one must execute one after the other. (The static indicator OFF command is a single byte command.)

## - Static Indicator ON/OFF

When the static indicator ON command is entered, the static indicator register set command is enabled. Once the static indicator ON command has been entered, no other command aside from the static indicator register set command can be used. This mode is cleared when data is set in the register by the static indicator register set command.

|  | $\mathbf{E}$ | $\mathbf{R} / \overline{\mathbf{W}}$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A0 | $\mathbf{R D}$ | $\mathbf{W R}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | Static Indicator |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | OFF |
|  |  |  |  |  |  |  |  |  |  | 1 | ON |

- Static Indicator Register Set

This command sets two bits of data into the static indicator register, and is used to set the static indicator into a blinking mode.

| A0 | $\mathbf{E}$ | $\mathbf{R D} / \overline{\mathbf{R D}}$ | $\overline{\text { WR }}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| 0 | 1 | 0 | $*$ | $*$ | $*$ | $*$ | $*$ | $*$ | 0 | 0 | OFF | Indicator Display State |
|  |  |  |  |  |  |  |  |  | 0 | 1 | ON (blinking at approximately one second intervals) |  |
|  |  |  |  |  |  |  |  |  | 1 | 0 | ON (blinking at approximately 0.5 second intervals) |  |

* Disabled bit
- Static Indicator Register Set Sequence

Figure 27

## Power Save (Compound Command)

When the display all points ON is performed while the display is in the OFF mode, the power saver mode is entered, thus greatly reducing power consumption.
The power saver mode has two different modes: the sleep mode and the standby mode. When the static indicator is OFF, it is the sleep mode that is entered. When the static indicator is ON, it is the standby mode that is entered.
In the sleep mode and in the standby mode, the display data is saved as is the operating mode that was in effect before the power saver mode was initiated, and the MPU is still able to access the display data RAM.
Refer to figure 26 for power save off sequence.

Figure 28

## - Sleep Mode

This stops all operations in the LCD display system, and as long as there are no accesses from the MPU, the consumption current is reduced to a value near the static current. The internal modes during sleep mode are as follows:
(1) The oscillator circuit and the LCD power supply circuit are halted.
(2) All liquid crystal drive circuits are halted, and the segment in common drive outputs output a VDD level.

## - Standby Mode

The duty LCD display system operations are halted and only the static drive system for the indicator continues to operate, providing the minimum required consumption current for the static drive. The internal modes are in the following states during standby mode.
(1) The LCD power supply circuits are halted. The oscillator circuit continues to operate.
(2) The duty drive system liquid crystal drive circuits are halted and the segment and common driver outputs output a Vdd level. The static drive system does not operate.
When a reset command is performed while in standby mode, the system enters sleep mode.

* When an external power supply is used, it is recommended that the functions of the external power supply circuit be stopped when the power saver mode is started. For example, when the various levels of liquid crystal drive voltage are provided by external resistive voltage dividers, it is recommended that a circuit be added in order to cut the electrical current flowing through the resistive voltage divider circuit when the power saver mode is in effect. The SED1565 series chips have a liquid crystal display blanking control terminal $\overline{\mathrm{DOF}}$. This terminal enters an "L" state when the power saver mode is launched. Using the output of $\overline{\mathrm{DOF}}$, it is possible to stop the function of an external power supply circuit.
* When the master is turned on, the oscillator circuit is operable immediately after the powering on.

## NOP

Non-OPeration Command

| A0 |  |  |  | D |  | D6 | D5 | D4 | D3 | D2 | D1 |  | D0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  |  | 0 | 1 |  | 1 | 1 | 0 | 0 | 0 |  |  |  |

## Test

This is a command for IC chip testing. Please do not use it. If the test command is used by accident, it can be cleared by applying a "L" signal to the RES input by the reset command or by using an NOP.

| A0 | $\frac{E}{R D}$ | $\begin{aligned} & R / \bar{W} \\ & \overline{W R} \end{aligned}$ | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | 1 | 1 | 1 | 1 | * | * | * | * |

* Inactive bit

Note: The SED1565 Series chips maintain their operating modes until something happens to change them. Consequently, excessive external noise, etc., can change the internal modes of the SED1565 Series chip. Thus in the packaging and system design it is necessary to suppress the noise or take measure to prevent the noise from influencing the chip. Moreover, it is recommended that the operating modes be refreshed periodically to prevent the effects of unanticipated noise.

SED1565 Series
Table 16 Table of SED1565 Series Commands

(Note) *: disabled data

## COMMAND DESCRIPTION

## Instruction Setup: Reference (reference)

(1) Initialization

Note: With this IC, when the power is applied, LCD driving non-selective potentials V2 and V3 (SEG pin) and V1 and $\mathrm{V} 4(\mathrm{COM}$ pin) are output through the LCD driving output pins SEG and COM. When electric charge is remaining in the smoothing capacitor connecting between the LCD driving voltage output pins (V1~V5) and the VDD pin, the picture on the display may become totally dark instantaneously when the power is turned on. To avoid occurrence of such a failure, we recommend the following flow when turning on the power.
(1) When the built-in power is being used immediately after turning on the power:

* The target time of 5 ms will result to vary depending on the panel characteristics and the capacitance of the smoothing capacitor. Therefore, we suggest you to conduct an operation check using the actual equipment.

## COMMAND DESCRIPTION

## Instruction Setup: Reference (reference)

(2) When the built-in power is not being used immediately after turning on the power:

* The target time of 5 ms will result to vary depending on the panel characteristics and the capacitance of the smoothing capacitor. Therefore, we suggest you to conduct an operation check using the actual equipment.

Notes: Refer to respective sections or paragraphs listed below.
*1: Description of functions; Resetting circuit
*2: Command description; LCD bias setting
*3: Command description; ADC selection
*4: Command description; Common output state selection
*5: Description of functions; Power circuit \& Command description; Setting the built-in resistance radio for regulation of the V5 voltage
*6: Description of functions; Power circuit \& Command description; Electronic volume control
*7: Description of functions; Power circuit \& Command description; Power control setting
*8: The power saver ON state can either be in sleep state or stand-by state.
Command description; Power saver START (multiple commands)
(2) Data Display

(2) Display start line set *9
(3) Page address set *10
(4) Column address set *11

Notes: Reference items
*9: Command Description; Display start line set

* 10: Command Description; Page address set
*11: Command Description; Column address set
*12: Command Description; Display data write
*13: Command Description; Display ON/OFF Avoid displaying all the data at the data display start (when the display is ON ) in white.
(3) Power OFF *14
- In case of SED1565Dbb, SED1566Dbb, SED1567Dbb, SED1568Dbb and SED1569Dbb,

- In case of other models,

> Set the time ( t L ) from power save to turning off the Vdd - Vss power (Vdd - Vss = 1.8 V ) longer than the time ( t н) when the potential of $\mathrm{V}_{5} \sim \mathrm{~V}_{1}$ becomes below the threshold voltage (approximately 1 V ) of the LCD panel.
> - th is determined depending on the voltage regulator external resistors Ra and Rb and the time constant of $\mathrm{V}_{5} \sim \mathrm{~V}_{1}$ smoothing capacity C 2.
> -When an internal resistor is used, it is recommended to insert a resistor $R$ between VDD and $\mathrm{V}_{5}$ to reduce th.

Notes: Reference items
*14: The logic circuit of this IC's power supply VDD - Vss controls the driver of the LCD power supply VDD - V5. So, if the power supply VDD - Vss is cut off when the LCD power supply VdD - V5 has still any residual voltage, the driver (COM. SEG) may output any uncontrolled voltage. When turning off the power, observe the following basic procedures:

- After turning off the internal power supply, make sure that the potential $\mathrm{V} 5 \sim \mathrm{~V} 1$ has become below the threshold voltage of the LCD panel, and then turn off this IC's power supply (VDD - Vss).

6. Description of Function, 6.7 Power Circuit
*15: After inputting the power save command, be sure to reset the function using the $\overline{\operatorname{RES}}$ terminal until the power supply VDD - VSS is turned off. 7. Command Description (20) Power Save
*16: After inputting the power save command, do not reset the function using the RES terminal until the power supply VDD - Vss is turned off. 7. Command Description (20) Power Save

## Refresh

It is recommended to turn on the refresh sequence regularly at a specified interval.

## Precautions on Turning off the power

- In case of SED1565Dbb, SED1566Dbb, SED1567Dbb, SED1568Dbb and SED1569Dbb, Observe Paragraph 1) as the basic rule.
<Turning the power (VDD - VSS) off>

1) Power Save (The LCD powers (VDD - V5) are off.) $\rightarrow$ Reset input $\rightarrow$ Power (VDD - Vss) OFF

- Observe tL > th.
- When $\mathrm{t}_{\mathrm{L}}<\mathrm{th}$, an irregular display may occur.

Set tL on the MPU according to the software. th is determined according to the external capacity $\mathrm{C}_{2}$ (smoothing capacity of $\mathrm{V}_{5} \sim \mathrm{~V}_{1}$ ) and the driver's discharging capacity.

<Turning the power (VDD - VSS) off : When command control is not possible.>
2) Reset (The LCD powers (VdD - Vss) are off.) $\rightarrow$ Power (VdD - Vss) OFF

- Observe tL > th.
- When tL < th, an irregular display may occur.

For $\mathrm{t}_{\mathrm{L}}$, make the power (VDD - Vss) falling characteristics longer or consider any other method. t H is determined according to the external capacity $\mathrm{C}_{2}$ (smoothing capacity of V 5 to $\mathrm{V}_{1}$ ) and the driver's discharging capacity.

## <Reference Data>

V5 voltage falling (discharge) time ( $\mathrm{t}_{\mathrm{H}}$ ) after the process of operation $\rightarrow$ power save $\rightarrow$ reset.
V5 voltage falling (discharge) time ( tH ) after the process of operation $\rightarrow$ reset.

Figure 29

- In case of other models than the above
<Turning the power (VDD - VSS) off>
Power save (The LCD powers (VDD - Vss) are off.) -> Power (VDD - Vss) OFF
- Observe tL > th.
- When $\mathrm{t}_{\mathrm{L}}<\mathrm{th}$, an irregular display may occur.

Set tL on the MPU according to the software. $\mathrm{t}_{\mathrm{H}}$ is determined according to the external capacity C (smoothing capacity of V 5 to $\mathrm{V}_{1}$ ) and the external resisters $\mathrm{Ra}+\mathrm{Rb}$ (for V 5 voltage regulation)

## ABSOLUTE MAXIMUM RATINGS

Unless otherwise noted, Vss $=0 \mathrm{~V}$
Table 17

| Parameter |  | Symbol | Conditions | Unit |

Figure 30
Notes and Cautions

1. The VSS2, V1 to V5 and Vout are relative to the VDD $=0 \mathrm{~V}$ reference.
2. Insure that the voltage levels of $V_{1}, V_{2}, V_{3}$, and $V_{4}$ are always such that $V_{D D} \geq V_{1} \geq V_{2} \geq V_{3} \geq V_{4} \geq V_{5}$.
3. Permanent damage to the LSI may result if the LSI is used outside of the absolute maximum ratings. Moreover, it is recommended that in normal operation the chip be used at the electrical characteristic conditions, and use of the LSI outside of these conditions may not only result in malfunctions of the LSI, but may have a negative impact on the LSI reliability as well.

## DC CHARACTERISTICS

Unless otherwise specified, Vss $=0 \mathrm{~V}, \mathrm{VDD}=3.0 \mathrm{~V} \pm 10 \%, \mathrm{Ta}=-40$ to $85^{\circ} \mathrm{C}$

- The Relationship Between Oscillator Frequency fosc, Display Clock Frequency fcl and the Liquid Crystal Frame Rate Frequency fFr

Table 25

| Item |  | fCL | fFR |
| :---: | :---: | :---: | :---: |
| SED1565*** | When the internal oscillator circuit is used | fosc | fosc |
|  |  | 4 | $4 \times 65$ |
|  | When the internal oscillator circuit is not used | External input (fCL) | fCL |
|  |  |  | 260 |
| SED1566*** | When the internal oscillator circuit is used | fosc | fosc |
|  |  | 8 | $8 \times 49$ |
|  | When the internal oscillator circuit is not used | External input (fCL) | fCL |
|  |  |  | 196 |
| SED1567*** | When the internal oscillator circuit is used | fosc | fosc |
|  |  | 8 | $8 \times 33$ |
|  | When the internal oscillator circuit is not used | External input (fcl) | fCL |
|  |  |  | 264 |
| SED1568*** | When the internal oscillator circuit is used | fosc | fosc |
|  |  | 8 | $8 \times 55$ |
|  | When the internal oscillator circuit is not used | External input (fCL) | fCL |
|  |  |  | 220 |
| SED1569*** | When the internal oscillator circuit is used | fosc | fosc |
|  |  | 8 | $\overline{8 \times 53}$ |
|  | When the internal oscillator circuit is not used | External input (fCL) | fCL |
|  |  |  | 212 |

(fFR is the liquid crystal alternating current period, and not the FR signal period.)
References for items market with *
*1 While a broad range of operating voltages is guaranteed, performance cannot be guaranteed if there are sudden fluctuations to the voltage while the MPU is being accessed.
*2 The operating voltage range for the VDD system and the V5 system is as shown in Figure 33. This applies when the external power supply is being used.
*3 The A0, D0 to D5, D6 (SCL), D7 (SI), RD (E), $\overline{\mathrm{WR}}$ (R/W), $\overline{\mathrm{CS}} 1, \mathrm{CS} 2, \mathrm{CLS}, \mathrm{CL}, \mathrm{FR}, \mathrm{M} / \mathrm{S}, \mathrm{C} 86, \mathrm{P} / \mathrm{S}, \overline{\mathrm{DOF}}$, RES, IRS, and HPM terminals.
*4 The D0 to D7, FR, FRS,$\overline{\mathrm{DOF}}$, and CL terminals.
*5 The A0, $\overline{\mathrm{RD}}(\mathrm{E}), \overline{\mathrm{WR}}(\mathrm{R} / \mathrm{W}), \overline{\mathrm{CS} 1}, \mathrm{CS} 2, \mathrm{CLS}, \mathrm{M} / \mathrm{S}, \mathrm{C} 86, \mathrm{P} / \mathrm{S}, \overline{\mathrm{RES}}, \mathrm{IRS}$, and $\overline{\mathrm{HPM}}$ terminals.
*6 Applies when the D0 to D5, D6 (SCL), D7 (SI), CL, FR, and $\overline{\text { DOF }}$ terminals are in a high impedance state.
*7 These are the resistance values for when a 0.1 V voltage is applied between the output terminal SEGn or COMn and the various power supply terminals $\left(\mathrm{V}_{1}, \mathrm{~V}_{2}, \mathrm{~V}_{3}\right.$, and $\left.\mathrm{V}_{4}\right)$. These are specified for the operating voltage (3) range.
RON $=0.1 \mathrm{~V} / \Delta \mathrm{I}$ (Where $\Delta \mathrm{I}$ is the current that flows when 0.1 V is applied while the power supply is ON. )
*8 See Table 9-7 for the relationship between the oscillator frequency and the frame rate frequency.
*9 The V5 voltage regulator circuit regulates within the operating voltage range of the voltage follower.
*10 This is the internal voltage reference supply for the V5 voltage regulator circuit. In the SED1565 Series chips, the temperature range can come in three types as VREG options: (1) approximately $-0.05 \% /{ }^{\circ} \mathrm{C}$, (2) $0.2 \% /{ }^{\circ} \mathrm{C}$, and (3) external input.
*11, 12 It indicates the current consumed on ICs alone when the internal oscillator circuit and display are turned on.
The SED1565 is $1 / 9$ biased, SED1566 is $1 / 8$ biased and SED1567 is $1 / 6$ biased.
Does not include the current due to the LCD panel capacity and wiring capacity.
Applicable only when there is no access from the MPU.
*12 It is the value on a model having the VREG option temperature gradient is $-0.05 \% /{ }^{\circ} \mathrm{C}$ when the V 5 voltage regulator internal resistor is used.

*1 The input signal rise time and fall time ( tr , tf ) is specified at 15 ns or less. When the system cycle time is extremely fast, ( $\mathrm{tr}+\mathrm{tf} \mathrm{f}) \leq(\mathrm{tcYC8}-\mathrm{tccLw}-\mathrm{tccHW})$ for $(\mathrm{tr}+\mathrm{tf}) \leq(\mathrm{tcYC8}-\mathrm{tcCLR}-\mathrm{tcCHR})$ are specified.
*2 All timing is specified using $20 \%$ and $80 \%$ of VDD as the reference.
*3 tcclw and tcCLR are specified as the overlap between CS1 being "L" (CS2 = "H") and $\overline{\mathrm{WR}}$ and $\overline{\mathrm{RD}}$ being at the "L" level.

*1 All timing is specified with $20 \%$ and $80 \%$ of VDD as the standard.

## THE MPU INTERFACE (REFERENCE EXAMPLES)

The SED1565 Series can be connected to either $80 \times 86$ Series MPUs or to 68000 Series MPUs. Moreover, using the serial interface it is possible to operate the SED 1565 series chips with fewer signal lines.
The display area can be enlarged by using multiple SED1565 Series chips. When this is done, the chip select signal can be used to select the individual ICs to access.

## NOTICE

Please be advised on the following points in the use of this development manual.

1. This manual is subject to change without previous notice.
2. This manual does not guarantee or furnish the industrial property right nor its execution.

Application examples in the manual are intended to ensure your better understanding of the product. Thus, the manufacturer shall not be liable for any trouble arising in your circuits from using such application example. Numerical values provided in the property table of this manual are represented with their magnitude on the numerical line.
3. No part of this manual may not be reproduced, copied or used for commercial purposes without a written permission from the manufacturer.

In handling of semiconductor devices, your attention is required to the following points.
[Precautions on Light]
Property of semiconductor devices may be affected when they are exposed to light, possibly resulting in malfunctioning of the ICs. To prevent such malfunctioning of the ICs mounted on the boards or products, make sure that:
(1) Your design and mounting layout done are so that the IC is not exposed to light in actual use.
(2) The IC is protected from light in the inspection process.
(3) The IC is protected from light in its front, rear and side faces.
