

AK4621

24-Bit 192kHz Stereo Audio CODEC

GENERAL DESCRIPTION

The AK4621 is a high performance 24-bit CODEC that supports up to 192kHz recording and playback. The on-board analog-to-digital converter has a high dynamic range due to AKM's Enhanced Dual-Bit architecture. The DAC utilizes AKM's Advanced Multi-Bit architecture that achieves low out-of-band noise and high jitter tolerance through the use of Switched Capacitor Filter (SCF) technology. The AK4621 is ideal for Pro Audio sound cards, Digital Audio Workstations, DVD-R, hard disk, CD-R recording/playback systems, and musical instrument recording.

FEATURES

- 24-bit 2-channel ADC
 - Full Differential Inputs
 - Selectable Digital Filter
 - 1. ADC Sharp Roll Off Filter (GD=39/fs)
 - Passband: 0 ~ 21.8kHz (@fs=48kHz)
 - Stopband Attenuation: 100dB
 - 2. ADC Short Delay Sharp Roll Off Filter (GD=14/fs) Passband: 0 ~ 21.7kHz (@fs=48kHz) Stophand Attenuation: 80dP
 - Stopband Attenuation: 80dB
 - S/(N+D): 102dB
 - S/N: 115dB
 - Digital High-pass Filter for Offset Cancellation
 - Overflow Flag
 - Audio Interface Format: MSB justified or I²S
- 24-bit 2-channel DAC
 - Selectable Digital Filter
 - 1. DAC Sharp Roll Off Filter (GD=27/fs) Passband: 0 ~ 21.8kHz (@fs=48kHz) Stopband Attenuation: 70dB
 - 2. DAC Slow Roll Off Filter (GD=27/fs) Passband: 0 ~ 8.9kHz (@fs=48kHz) Stopband Attenuation: 73dB
 - 3. DAC Short Delay Sharp Roll Off Filter (GD=7/fs) Passband: 0 ~ 21.8kHz (@fs=48kHz) Stopband Attenuation: 70dB
 - Switched-cap Low Pass Filter
 - Differential Outputs
 - S/(N+D): 100dB
 - S/N: 115dB
 - De-emphasis for 32kHz, 44.1kHz, 48kHz Sampling
 - Output Digital Attenuator: 0dB ~ 72dB, Linear 256 + 16steps
 - Zero Detection Function
 - Audio Interface Format: MSB justified, LSB justified, I²S
- High Jitter Tolerance
- □ Sampling Rate: 32kHz ~ 216kHz
- **□** μP Interface: 3-wire Serial Interface
- □ Master Clock: 128fs/192fs/256fs/384fs/512fs/768fs/1024fs

```
    □ Power Supply
        Analog: 4.75 ~ 5.25V (typ. 5.0V)
        Digital: 3.0 ~ 3.6V (typ. 3.3V)
        Digital I/O: DVDD ~ 5.25V (typ. 5.0V)

    □ Package: 30pin VSOP
    □ Ta: -10 ~ 70 °C
```

These bits were added in the AK4621. These bits were deleted in the AK4621.

PIN/FUNCTION

| No. | Pin Name | I/O | Function |
|-----|----------|-----|---|
| | | 0 | Common Voltage Output Pin, (AVDD)/2 |
| 1 | VCOM | 0 | Bias voltage of ADC inputs and DAC outputs. |
| 2 | AINR+ | Ι | Rch Positive Input Pin |
| 3 | AINR- | Ι | Rch Negative Input Pin |
| 4 | AINL+ | Ι | Lch Positive Input Pin |
| 5 | AINL- | Ι | Lch Negative Input Pin |
| | | | Voltage Reference Input Pin, AVDD |
| 6 | VREF | Ι | Used as a voltage reference by ADC & DAC. VREF is connected externally to filtered |
| | | | AVDD. |
| 7 | VSS1 | - | Analog Ground Pin |
| 8 | AVDD | - | Analog Power Supply Pin, 4.75 ~ 5.25V |
| | | | Parallel/Serial Mode Select Pin |
| 9 | P/S | Ι | "L": Serial Mode, "H": Parallel Mode |
| | | | Do not change this pin during PDN pin = "H". |
| 10 | MCLK | Ι | Master Clock Input Pin |
| 11 | LRCK | Ι | Input/Output Channel Clock Pin |
| 12 | BICK | Ι | Audio Serial Data Clock Pin |
| 13 | SDTO | Ο | Audio Serial Data Output Pin |
| 14 | SDTI | Ι | Audio Serial Data Input Pin |
| 15 | OVFR | 0 | Rch Over Flow Flag Pin (in Parallel mode or when ZOS bit="0" in Serial Mode) |
| 15 | DZFR | Ο | Rch Zero Detection Flag Pin (when ZOS bit="1" in Serial Mode) |
| 16 | OVFL | 0 | Lch Over Flow Flag Pin (in Parallel mode or when ZOS bit="0" in Serial Mode) |
| 10 | DZFL | Ο | Lch Zero Detection Flag Pin (when ZOS bit="1" in Serial Mode) |
| 17 | CDTI | Ι | Control Data Input Pin (in Serial Mode) |
| 17 | CKS0 | Ι | Master Clock Select Pin (in Parallel Mode) |
| 18 | CCLK | Ι | Control Data Clock Pin (in Serial Mode) |
| 10 | CKS1 | Ι | Master Clock Select Pin (in Parallel Mode) |
| | CSN | Ι | Chip Select Pin in Serial Mode (in Serial Mode) |
| 19 | DIF | Ι | Digital Audio Interface Select Pin (in Parallel Mode) |
| | | | "L": 24bit MSB justified, "H": I2S compatible |
| 20 | DFS0 | Ι | Double Speed Sampling Mode Pin |
| 21 | PDN | Ι | Power-Down Mode Pin |
| | | | "L": Power down reset and initialize the control register, "H": Power up |
| 22 | DEM0 | Ι | De-emphasis Control Pin |
| | ODDU | - | Digital Filter Select Pin |
| 23 | SDFIL | Ι | "L": Short Delay Sharp Roll Off Filter (ADC), Short Delay Sharp Roll Off Filter (DAC) |
| | TUDE | | "H": Sharp Roll Off Filter (ADC), Sharp Roll Off Filter (DAC) |
| 24 | TVDD | - | Digital I/O Power Supply Pin, DVDD ~ 5.25V |
| 25 | DVDD | - | Digital Power Supply Pin, 3.0 ~ 3.6V |
| 26 | VSS2 | - | Digital Ground Pin |
| 27 | AOUTL- | 0 | Lch Negative Analog Output Pin |
| 28 | AOUTL+ | 0 | Lch Positive Analog Output Pin |
| 29 | AOUTR- | 0 | Rch Negative Analog Output Pin |
| 30 | AOUTR+ | 0 | Rch Positive Analog Output Pin |

Note 1. All digital input pins (P/S, MCLK, LRCK, BICK, SDTI, CDTI/CKS0, CCLK/CKS1, CSN/DIF, DFS0, PDN, DEM0 and SDFIL) must not be left floating.

Handling of Unused Pin

The unused I/O pin must be processed appropriately as below.

| Classification | Pin Name | Setting |
|----------------|--------------------------------|--------------------------------------|
| Analog Input | AINL+, AINL- | AINL+ pin is connected to AINL- pin. |
| Analog Input | AINR+, AINR- | AINR+ pin is connected to AINR- pin. |
| Analog Output | AOUTL+, AOUTL-, AOUTR+, AOUTR- | These pins must be open. |
| Digital Output | OVFL/DZFL, OVFR/DZFR | These pins must be open. |

ABSOLUTE MAXIMUM RATINGS

| (VSS1=VSS2=0V; N | Note 2, Note 3) | | | | | |
|---------------------|---------------------|------|--------|------|----------|-------|
| Parameter | | | Symbol | min | max | Units |
| Power Supplies: | Analog | | AVDD | -0.3 | 6.0 | V |
| | Digital | | DVDD | -0.3 | 6.0 | V |
| | Digital I/O | | TVDD | -0.3 | 6.0 | V |
| Input Current, Any | Pin Except Supplies | | IIN | - | ±10 | mA |
| Analog Input Volta | lge (Not | e 4) | VINA | -0.3 | AVDD+0.3 | V |
| Digital Input Volta | ge (Not | e 5) | VIND | -0.3 | TVDD+0.3 | V |
| Ambient Temperat | ure (power applied) | | Та | -10 | 70 | °C |
| Storage Temperatu | re | | Tstg | -65 | 150 | °C |

Note 2. All voltages with respect to ground.

Note 3. VSS1 and VSS2 must be connected to the same analog ground plane.

Note 4. AINL+, AINL-, AINR+ and AINR- pins

Note 5. P/S, MCLK, LRCK, BICK, SDTI, CDTI/CKS0, CCLK/CKS1, CSN/DIF, DFS0, PDN, DEM0 and SDFIL pins.

WARNING: Operation at or beyond these limits may result in permanent damage to the device. Normal operation is not guaranteed at these extremes.

| | RECOMMENDED OPERATING CONDITIONS | | | | | | | | | | |
|------------------------|----------------------------------|--------|------|-----|------|-------|--|--|--|--|--|
| (VSS1=VSS2=0V; Note 2) | | | | | | | | | | | |
| Parameter | | Symbol | min | typ | max | Units | | | | | |
| Power Supplies | Analog | AVDD | 4.75 | 5.0 | 5.25 | V | | | | | |
| (Note 6) | Digital | DVDD | 3.0 | 3.3 | 3.6 | V | | | | | |
| | Digital I/O | TVDD | DVDD | 5.0 | 5.25 | V | | | | | |
| Voltage Reference | e | VREF | 3.0 | - | AVDD | V | | | | | |

Note 2. All voltages with respect to ground.

Note 6: The power up sequence among AVDD, DVDD and TVDD is not critical.

WARNING: AKM assumes no responsibility for the usage beyond the conditions in this datasheet.

| | | -0.1dB | | - | 26.0 | - | Hz | | | | |

Note 16: The passband and stopband frequencies scale with fs. Each response refers to that of 1kHz

Note 17: The calculated delay time induced by digital filtering. This time is from the input of an analog signal to the setting of 24bit data both channels to the ADC output register for ADC. If the signal is outputted to the SDTO pin, group delay is increased 0.5/fs from the above value.

Timing Diagram

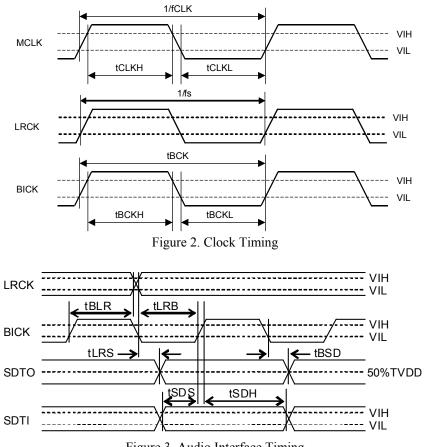

Figure 3. Audio Interface Timing

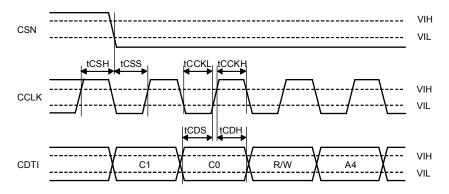

Figure 4. WRITE Command Input Timing

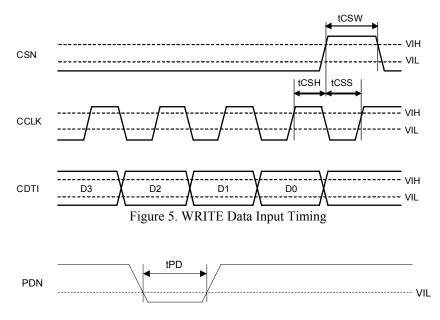

Figure 6. Power Down & Reset Timing

OPERATION OVERVIEW

System Clock Input

The AK4621 requires MCLK, BICK and LRCK external clocks. MCLK must be synchronized with LRCK but the phase is not critical. The AK4621 is automatically placed in power-down state when MCLK is stopped more than 9.38µs during a normal operation (PDN pin ="H"), then the digital output becomes "0" data and the analog output becomes Hi-Z. When MCLK and LRCK are input again, the AK4621 exit power-down state and starts the operation. After exiting system reset (PDN pin ="L"→"H") at power-up and other situations, the AK4621 is in power-down mode until MCLK is supplied.

As the AK4621 includes the phase detect circuit for LRCK, the AK4621 is reset automatically when the synchronization is out of phase by changing the clock frequencies.

1. Serial mode (P/S pin= "L")

As shown in Table 1, Table 2 and Table 3, select the MCLK frequency by setting CMODE, CKS1-0 and DFS1-0 bits. These registers are changed when RSTAD bit = RSTDA bit = "0".

| DFS1 bit | DFS0 bit | Mode | Sampling Rate | |
|----------|----------|--------------|---------------|-----------|
| 0 | 0 | Normal speed | 32kHz-54kHz | (default) |
| 0 | 1 | Double speed | 54kHz-108kHz | |
| 1 | 0 | Quad speed | 108kHz-216kHz | |
| 1 | 1 | N/A | - | |

Table 1. Sampling Speed in Serial Mode (N/A: Not Available)

| CMODE bit | CKS1 bit | CKS0 bit | MCLK Normal Speed (DFS1-0 = "00") | MCLK Double Speed (DFS1-0 = "01") | MCLK Quad Speed (DFS1-0 = "10") | |
|-----------|----------|----------|---|---|---------------------------------------|-----------|
| 0 | 0 | 0 | 256fs | N/A | N/A | (default) |
| 0 | 0 | 1 | 512fs | 256fs | 128fs | |
| 0 | 1 | 0 | 1024fs | 512fs | 256fs | |

| 1 | 0 | 1 | 768fs | 384fs | 192fs | |

Table 2. Master Clock frequency in Serial Mode ("*"; refer to Table 3.) (N/A: Not Available)

The Auto Setting Mode detects MCLK/LRCK ratio and selects Normal/Double/Quad speed mode automatically (Table 3).

| MCLK/LRCK ratio | Mode | Sampling Rate |
|-----------------|--------------|---------------|
| 512 or 768 | Normal speed | 32kHz-54kHz |
| 256 or 384 | Double speed | 54kHz-108kHz |
| 128 or 192 | Quad speed | 108kHz-216kHz |

Table 3. Auto Setting Mode in Serial Mode (DFS1-0 bits = "01", CMODE bit = "0", CKS1-0 bits = "11")

2. Parallel mode (P/S pin= "H")

As shown in Table 4, Table 5 and Table 6, select the MCLK frequency with the CKS0-1 and DFS0 pins. These pins must be changed when the PDN pin = "L".

| DFS0 pin | Mode | Sampling Rate | | |
|--|--------------|---------------|--|--|
| L | Normal speed | 32kHz-54kHz | | |
| Н | Double speed | 54kHz-108kHz | | |
| Table 4. Sampling Speed in Parallel Mode | | | | |

Table 7. Master Clock Frequency Example (N/A: Not Available)

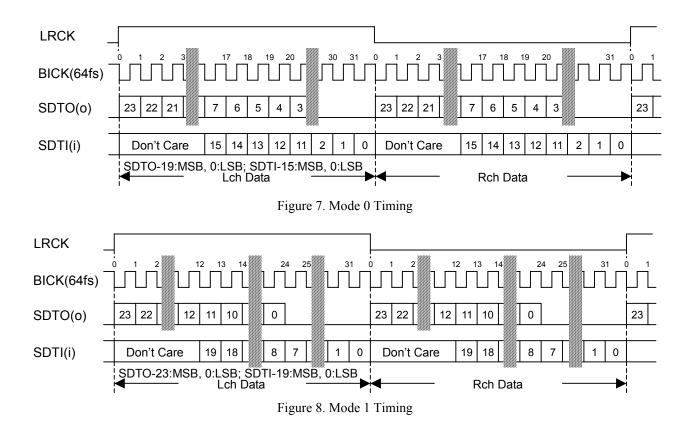

■ Audio Serial Interface Format

Five serial modes are supported and selected by the DIF2-0 bits in Serial Mode (two modes by DIF pin in Parallel Mode) as shown in Table 8 and Table 9. In all modes the serial data has MSB first, 2's complement format. The SDTO is clocked out on the falling edge of BICK and the SDTI is latched on the rising edge. Mode2 can be used for 20 and 16 MSB justified formats by zeroing the unused LSBs.

| Mode | DIF2 | DIF1 | DIF0 | SDTO | SDTI | LRCK | BICK |] |
|------|------|------|------|-------------------------|-------------------------|------|-------------|-----------|
| 0 | 0 | 0 | 0 | 24bit, MSB justified | 16bit, LSB justified | H/L | \geq 48fs | |
| 1 | 0 | 0 | 1 | 24bit, MSB justified | 20bit, LSB justified | H/L | \geq 48fs | |
| 2 | 0 | 1 | 0 | 24bit, MSB justified | 24bit, MSB justified | H/L | \geq 48fs | (default) |
| 3 | 0 | 1 | 1 | 24bit, I ² S | 24bit, I ² S | L/H | \geq 48fs | |
| 4 | 1 | 0 | 0 | 24bit, MSB justified | 24bit, LSB justified | H/L | \geq 48fs | |

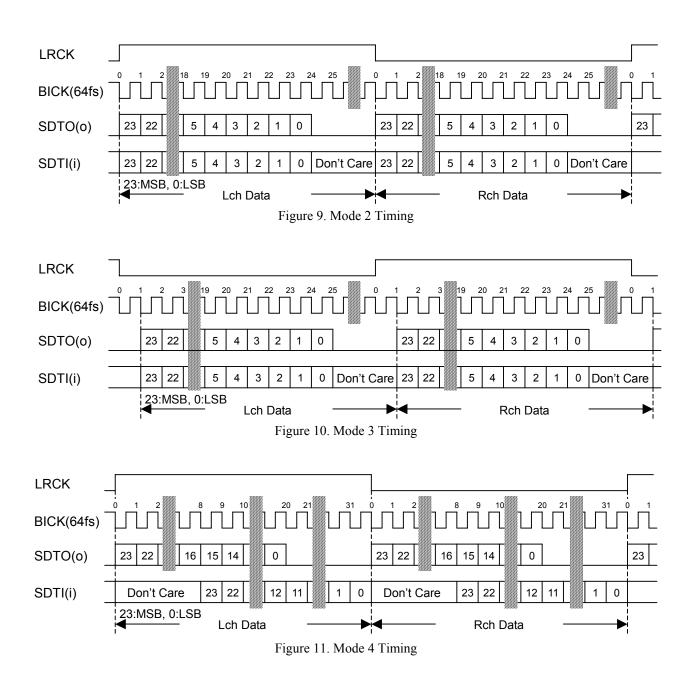

Table 8. Audio Data Format (Serial Mode)

| Mode | DIF pin | SDTO | SDTI | LRCK | BICK |
|--|---------|-------------------------|-------------------------|------|-----------------------|
| 2 | L | 24bit, MSB justified | 24bit, MSB justified | H/L | \geq 48fs |
| 3 | Н | 24bit, I ² S | 24bit, I ² S | L/H | $\geq 48 \mathrm{fs}$ |

Output Volume

The AK4621 includes channel independent digital output volumes (DATT) with 256 levels and extension digital output volumes (EATT) with 16 levels at linear steps including MUTE. When EXTE bit = "1", the extension digital output volumes are enabled. These volumes are in front of the DAC. If the extension digital output volumes are disabled, the volumes can attenuate the input data from 0dB to -48dB and mute. If the extension digital output volumes are enabled, the volumes can attenuate the input data from 0dB to -72dB and mute. When changing levels, transitions are executed via soft changes, eliminating any switching noises. The transition time of 1 level, all 256 levels and all 256+16 is shown in Table 10. Volume calculating formula is shown in Table 13.

| | Transition Time | | | |
|-------------------|-----------------|------------------------------|---------------------------------|--|
| Sampling Speed | 1 Level | 255 to 0 (EXTE bit = "0") | 255+15 to 0 (EXTE bit = "1") | |
| Normal Speed Mode | 4LRCK | 1020LRCK | 1080LRCK | |
| Double Speed Mode | 8LRCK | 2040LRCK | 2160LRCK | |
| Quad Speed Mode | 16LRCK | 4080LRCK | 4320LRCK | |

| DATTL7-0 bits DATTR7-0 bits | DATT_DATA | EATTL3-0 bits EATTR3-0 bits | GAIN(0dB) | |
|--------------------------------|-----------|--------------------------------|-----------|-----------|
| FFH | 255 | | +0 | (default) |
| FEH | 254 | | -0.034 | |
| FDH | 253 | | -0.068 | |
| : | : | FH | ••• | |
| 02H | 2 | | -42.11 | |
| 01H | 1 | | -48.13 | |
| 00H | - | | Mute | |

| Table 10 | . Output Digital | Volume | Transition | Time |
|----------|------------------|--------|------------|------|
|----------|------------------|--------|------------|------|

Table 11. Output Digital Volume Setting (EXTE bit = "0")

| DATTL7-0 bits DATTR7-0 bits | DATT_DATA | EATTL3-0 bits EATTR3-0 bits | EATT_DATA | GAIN(0dB) |
|--------------------------------|-----------|--------------------------------|-----------|-----------|
| FFH | 255 | | | +0 |
| FEH | 254 | | | -0.034 |
| FDH | 253 | FH | _ | -0.068 |
| • | : | 111 | - | : |
| 02H | 2 | | | -42.11 |
| 01H | 1 | | | -48.13 |
| | | FH | 15 | -48.72 |
| | | EH | 14 | -49.32 |
| 00H | | : | : | : |
| 0011 | - | 2H | 2 | -66.22 |
| | | 1H | 1 | -72.25 |
| | | 0H | - | Mute |

Note 24. If the volume is set from DATT gain to EATT gain or from EATT gain to DATT gain, these register must be wrote continuously within 4LRCK cycles in Normal Speed Mode. When the volume setting is not complete within 4LRCK cycles, the volume transition may stop.

Table 12. Output Digital Volume Setting (EXTE bit = "1")

| DATTL7-0 bits DATTR7-0 bits | EATTL3-0 bits EATTR3-0 bits | GAIN(dB) |

| FFH : 01H | FH | 20 log ₁₀ (DATT_DATA / 255) |
| 00H | FH : 1H | 20 log ₁₀ (EATT_DATA / 4095) |

Table 13. Output Digital Volume Formula

Overflow Detection

The ADC has a channel independent overflow detection function. This function is enabled in parallel control mode, or when the ZOS bit = ZOE bit = "0" in serial control mode. OVFL/R pins go to "H" if each Lch/Rch analog input overflows (exceeds -0.3dBFS). The output of each OVFL/R pin has same group delay as ADC against analog inputs. OVFL/R pin is "L" for 516/fs (=10.8ms @fs=48kHz) after the PDN pin = " \uparrow ", and then overflow detection is enabled.

Zero Detection

The DAC has a channel-independent zero detect function. The zero detect function is enabled when the ZOS bit = "1" and the ZOE bit = "0" in serial control mode. When the input data at both channels is continuously zero for 8192 LRCK cycles, the DZF pin of each channel goes to "H". The DZF pin of each channel immediately returns to "L" if the input data of each channel is not zero after DZF "H". If the RSTDA bit is "0", the DZF pins of both channels go to "H". The DZF pins of both channels return to "L" in 2~3fs if the input data of each channel is not zero. Zero detect function can be disabled by the ZOE bit. In this case, the DZF pins of both channels are always "L". The DZFB bit can invert the polarity of the DZF pin.

■ Digital High Pass Filter

The ADC has a digital high pass filter for DC offset cancellation. The cut-off frequency of the HPF is 1.0Hz at fs=48kHz. The digital high pass filter cut-off frequency scales with the sampling rate (fs). In parallel mode, the HPF is always enabled. In serial mode, the HPF can control each channel by HPLN/HPRN bits.

Digital Filter

The AK4621 has two kinds of Digital Filter for ADC and three kinds of Digital Filter for DAC. The outputs of ADC and DAC can be controlled by using the SDFIL pin or SDAD/SDDA/SLOW bits.

| SDFIL pin | ADC | DAC |
|-----------|-----------------------------------|-----------------------------------|
| L | Short Delay Sharp Roll Off Filter | Short Delay Sharp Roll Off Filter |
| Н | Sharp Roll Off Filter | Sharp Roll Off Filter |

Table 14. Digital Filter Selection in Parallel Mode

| SDAD bit | ADC | |

| 0 1 Slow Roll Off Filter | |
| 1 0 Short Delay Sharp Roll Off Filter | |
| 1 1 N/A | |

Table 16. DAC Digital Filter Selection in Serial Mode (N/A: Not Available)

■ De-emphasis Filter

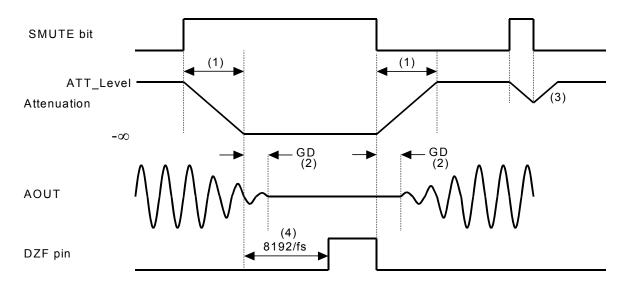

The DAC includes a digital de-emphasis filter (tc=50/15µs for 32kHz, 44.1kHz or 48kHz sampling rates) by an integrated IIR filter. Setting the DEM1-0 bits enables the de-emphasis filter. This filter is always OFF in double and quad speed modes. The DEM0 pin and DEM0 bit are OR'd in serial control mode. In parallel control mode, the DEM1 bit is fixed to "0" and only the DEM0 pin can be controlled (44.1kHz or OFF).

| No | DEM1 | DEM0 | Mode | |
|----|------|------|---------|-----------|
| 0 | 0 | 0 | 44.1kHz | |
| 1 | 0 | 1 | OFF | (default) |
| 2 | 1 | 0 | 48kHz | |
| 3 | 1 | 1 | 32kHz | |

Table 17. De-emphasis control (Normal Speed Mode)

■ Soft Mute Operation

Soft mute operation is performed in the digital domain of the DAC input. When the SMUTE bit goes to "1", the output signal is attenuated by $-\infty$ during ATT_DATA × ATT transition time (Table 10) from the current ATT level. When SMUTE bit is returned to "0", the mute is cancelled and the output attenuation gradually changes to the ATT level during ATT_DATA × ATT transition time. If soft mute is cancelled before attenuating to $-\infty$ after starting the operation, the attenuation is discontinued and returns to ATT level by the same cycle. The soft mute is effective for changing the signal source without stopping the signal transmission.

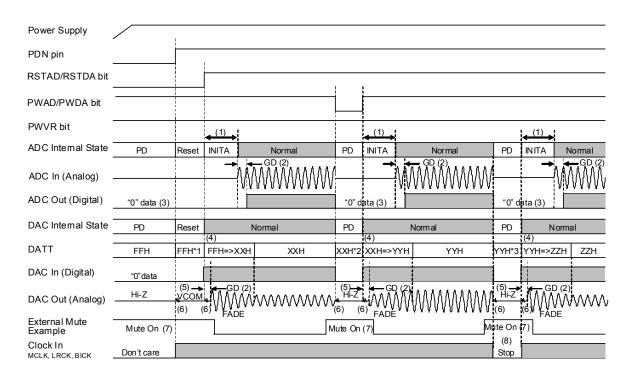

Notes:

- (1) ATT_DATA × ATT transition time (Table 10). For example, in Normal Speed Mode, if the EATT is disabled, this time is 1020LRCK cycles (1020/fs). If the EATT is enabled, this time is 1080LRCK cycles (1080/fs).
- (2) Analog output corresponding to digital input has group delay (GD).
- (3) If the soft mute is cancelled before attenuating $-\infty$, the attenuation is discontinued and returned to ATT level by the same cycle.
- (4) When the input data at each channel is continuously zero for 8192 LRCK cycles, the DZF pin of each channel goes to "H". The DZF pin immediately returns to "L" if input data are not zero after going to "H".

Figure 12. Soft Mute and Zero Detection

■ Power Down & Reset

The ADC and DAC of AK4621 are placed in power-down mode by bringing the PDN pin = "L". Each digital filter is also reset at the same time. The internal register values are initialized by bringing the PDN pin to "L". This reset must always be done after power-up. As both control registers of the ADC and the DAC go to the reset state (RSTAD bit = RSTDA bit = "0"), each register must be cleared after executing the reset. In the case of the ADC, an analog initialization cycle starts after exiting the power-down or reset state. The output data (SDTO) is available after 516 cycles of LRCK clock. This initialization cycle does not affect the DAC operation. Power down mode can be also controlled by the registers (PWAD bit, PWDA bit).

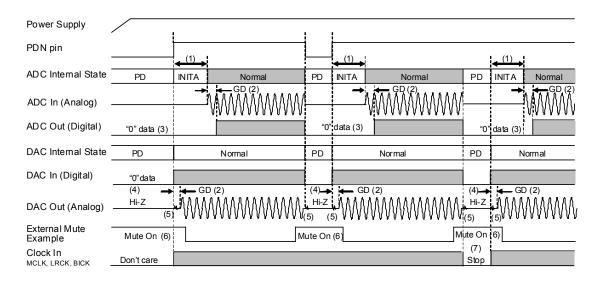

Notes:

- (1) After exiting power down and reset state, the analog part of ADC is initialized (516/fs).
- (2) Digital output corresponding to analog input and analog input corresponding to digital input have group delay (GD).
- (3) ADC output is "0" data in power-down state.
- (4) After exiting power down and reset state, ATT value fades in/out.
 - *1 When RSTDA is "L" and DATT value is written to "XXH", DATT value changes from FFH to XXH according to fade operation.
 - *2 When PWDA is "L" and DATT value is written to "YYH", DATT value changes from XXH to YYH according to fade operation.
 - *3 When the external clocks (MCLK, SCLK, LRCK) are stopped and DATT value is written to "ZZH", DATT value changes from YYH to ZZH according to fade operation.
- (5) In the power-down mode, the DAC output is VCOM level. In the reset state, the DAC output is floating (Hi-z).
- (6) Click noise occurs after RSTDA bit or PWDA bit is changed.
- (7) Mute the analog output externally if the click noise (6) influences system application.
- (8) When MCLK is stopped more than 9.38µs, the AK4621 becomes power down mode. Then ADC output is "0" data and DAC output is floating (Hi-Z).

Figure 13. Reset & Power down sequence in serial mode

Asahi KASEI

In parallel mode, both ADC and DAC are powered up when releasing internal reset state by the PDN pin = "H". When the PDN pin is "L", after exiting power down mode ADC s output "0" during first 516/fs cycles. DAC does not have the initialization cycle and the operation of fade-in.

Notes:

(1) After exiting power down and reset state, the analog part of ADC is initialized (516/fs).

(2) Digital output corresponding to analog input and analog input corresponding to digital input have group delay (GD).

- (3) ADC output is "0" data in power-down state.
- (4) DAC output is floating (Hi-z) in power-down state.
- (5) Click noise occurs at the rising/falling edge of PDN.
- (6) Mute the analog output externally if the click noise (5) influences system application.
- (7) When MCLK is stopped more than 9.38µs, the AK4621 becomes power down mode. Then ADC output is "0" data and DAC output is floating (Hi-Z).

Figure 14. Reset & Power Down Sequence in parallel mode

Serial Control Interface

The internal registers may be written by the 3-wire μ P interface pins: CSN, CCLK, CDTI. The data on this interface consists of Chip address (2bits, C0/1) Read/Write (1 bit), Register address (MSB first, 5 bits) and Control data (MSB first, 8 bits). Address and data are clocked in on the rising edge of CCLK and data is latched after the 16th rising edge of CCLK, following a high-to-low transition of CSN. Operation of the control serial port may be completely asynchronous with the audio sample rate. The maximum clock speed of the CCLK is 5MHz. The chip address is fixed to "10". The access to the chip address except for "10" is invalid. PDN pin = "L" resets the registers to their default values.

| Function | Parallel mode | Serial mode |
|--|---------------|-------------|
| Overflow detection | Х | Х |
| DAC Slow Roll Off Filter | - | Х |
| Zero detection | - | Х |
| Soft Mute | - | Х |
| DATT | - | Х |
| HPF OFF | - | Х |
| 16/20/24 bit LSB justified format of DAC | - | Х |
| MCLK = 256fs @ Quad Speed | - | Х |
| De-emphasis: 32kHz, 48kHz | - | Х |

Table 18. Function List (X: available, -: not available)

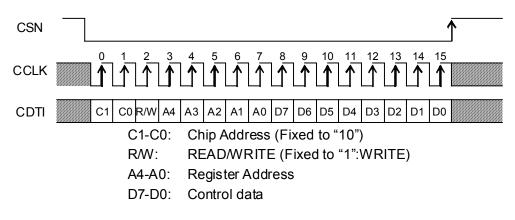

Figure 15. Control I/F Timing

* READ command is not supported.

* The control data can not be written when the CCLK rising edge is 15times or less or 17times or more during CSN is "L".

Note 25: Data must not be written to addresses 0AH through 1FH.

PDN pin = "L" resets the registers to their default values.

■ Control Register Setup Sequence

When the PDN pin goes "L" to "H" upon power-up etc., the AK4621 will be ready for normal operation by the sequence below. In this case, all control registers are set to default values and the AK4621 is in the reset state.

- (1) Set the clock mode and the audio data interface mode.
- (2) Cancel the reset state by setting RSTAD bit or RSTDA bit to "1". Refer to Reset Contorl Register (01H).
- (3) ADC output and DAC output must be muted externally until canceling each reset state.

The clock mode must be changed after setting RSTAD bit and RSTDA bit to "0". At that time, ADC outputs and DAC outputs must be muted externally.

Register Definitions

| Addr | Register Name | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|---------|--------------------|------|------|-----|-----|------|------|------|------|
| 00H | Power Down Control | SLOW | DZFB | ZOE | ZOS | SDDA | PWVR | PWAD | PWDA |
| Default | | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

PWDA: DAC power down

0: Power down

1: Power up (default)

When PWDA bit = "0", only the DAC block is powered down and the AOUT becomes Hi-z immediately. In this time, all registers are not initialized, and register writings are valid. After exiting power down mode, the OATT fades in/out the setting value of the control register (06H, 07H, 08H, 09H). The analog output must be muted externally as a pop noise may occur when entering and exiting this mode.

PWAD: ADC power down

- 0: Power down
- 1: Power up (default)

When PWAD bit = "0", only the ADC block is powered-down and the SDTO pin becomes "L" immediately. After exiting power down mode, the ADC outputs "0" during first 516 LRCK cycles.

PWVR: Vref power down

- 0: Power down
- 1: Power up (default)

When PWVR bit = "0", all blocks are powered down. Both ADC and DAC cannot operate. In this time, all registers are not initialized, and register writings are valid. Only the VRFE block can be powered up by setting PWAD = PWDA bit = "0" and PWVR bit = "1".

SDDA: DAC Short Delay Sharp Roll Off Filter Enable (Table 16) Default: Disable

ZOS: Zero-detection/ Overflow-detection control for OVFL/DZFL and OVFR/DZFR pins.

- 0: Overflow detection for ADC input (default)
- 1: Zero detection for DAC input.
- ZOE: Zero-detection / Overflow-detection Disable

0: Enable (default)

1: Disable. Outputs "L".

- DZFB: Inverting Enable of DZF
- 0: DZF goes "H" at Zero Detection (default)
 - 1: DZF goes "L" at Zero Detection
- SLOW: DAC Slow Roll Off Filter Enable (Table 16) Default: Disable

| Addr | Register Name | D7 | : | D6 | : | D5 | - : | D4 | : | D3 | : | D2 | : | D1 | : D0 |
|------|---------------|----|---|----|---|----|-----|------|---|----|---|----|---|-------|-------|
| 01H | Reset Control | 0 | : | 0 | : | 0 | : | SDAD | : | 0 | : | 0 | | RSTAD | RSTDA |
| | Default | | | 0 | ł | 0 | ÷ | 0 | ÷ | 0 | | 0 | ÷ | 0 | 0 |

RSTDA: DAC reset

0: Reset (default)

1: Normal Operation

When RSTDA bit ="0", the internal timing of DAC is reset and the AOUT becomes VCOM voltage immediately. In this time, all registers are not initialized, and register writings are valid. After exiting the power down mode, the OATT fades in the setting values of the control register (06H, 07H, 08H, 09H). The analog outputs must be muted externally since a pop noise may occur when entering to and exiting from this mode.

RSTAD: ADC reset

0: Reset (default)

1: Normal Operation

When RSTAD bit ="0", the internal timing of ADC is reset and the SDTO pin becomes "L" immediately. In this time, all registers are not initialized, and register writings are valid. After exiting the power down mode, the ADCs output "0" during first 516 LRCK cycles.

SDAD: ADC Short Delay Sharp Roll Off Filter Enable (Table 15) Default: Disable

| Addr | Register Name | D7 | : D6 | - | D5 | D4 | D3 | D2 | D1 | D0 |

SYSTEM DESIGN

Figure 16 shows the system connection diagram. An evaluation board (AKD4621) is available for fast evaluation as well as suggestions for peripheral circuitry.

Notes:

- VSS1 and VSS2 must be connected to the same analog ground plane.
- When AOUT+/- drives some capacitive load, some resistance must be added in series between AOUT+/- and capacitive load.
- All digital input pins must not be left floating.

Figure 16. Typical Connection Diagram

| Digita | I Ground | | Analog Grour | nd | | | |
|--------|------------|--------|--------------|--------|--------|----------|----|

| | | | 15 | OVFR/D | ZFR O | VFL/DZFL | 16 |

Figure 17. Ground Layout

1. Ground and Power Supply Decoupling

The AK4621 requires careful attention to power supply and grounding layout. To minimize coupling from digital noise, decoupling capacitors must be connected to AVDD, DVDD and TVDD respectively. AVDD is supplied from the analog supply in the system, and DVDD and TVDD are supplied from the digital supply in the system. Power lines of AVDD, DVDD and TVDD must be distributed separately from the point with low impedance of regulator etc. The power up sequence is not critical among AVDD, DVDD and TVDD. **VSS1 and VSS2 must be connected to one analog ground plane.** Decoupling capacitors must be as near to the AK4621 as possible, with the small value ceramic capacitor being the nearest.

2. Voltage Reference

The differential voltage between VREF and VSS1 sets the analog input/output range. The VREF pin is normally connected to AVDD with a 0.1μ F ceramic capacitor. VCOM is the signal ground of this chip. A 10μ F electrolytic capacitor in parallel with a 0.1μ F ceramic capacitor attached to the VCOM pin eliminates the effects of high frequency noise. No load current may be drawn from the VCOM pin. All signals, especially clocks, must be kept away from the VREF and VCOM pins in order to avoid unwanted coupling into the AK4621.

3. ADC Output

The ADC output data format is 2's complement. The DC offset, including the ADC's own DC offset, is removed by the internal HPF (fc=1.0Hz@fs=48kHz). The AK4621 samples the analog inputs at 128fs (@Normal Speed Mode), 64fs (@Double Speed Mode) or 32fs (@Quad Speed Mode). The digital filter rejects noise above the stopband except for multiples of 128fs (@Normal Speed Mode), 64fs (@Double Speed Mode) or 32fs (@Quad Speed Mode).

4. Analog Inputs

The AK4621 can accept input voltages from VSS1 to AVDD. The input signal range scales with the VREF voltage and is nominally 2.82Vpp (VREF = 5V), centered around the internal common voltage (about VA/2). Figure 18 shows an input buffer circuit example. This is a fully differential input buffer circuit with an inverted amplifier (gain: -10dB). The capacitor of 10nF between AINL+/- (AINR+/-) decreases the clock feedthrough noise of the modulator, and it composes a 1st order LPF (fc=360kHz) with a 22 Ω resistor before the capacitor. This circuit also has a 1st order LPF (fc=370kHz) composed of op-amp. Refer to an evaluation board for details.

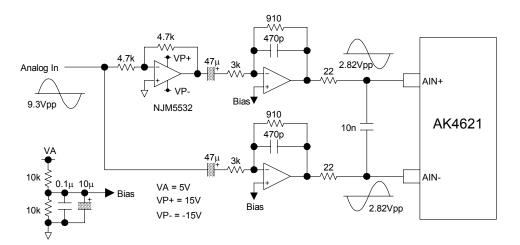

Figure 18. Input Buffer Example

5. Analog Outputs

The analog outputs are fully differential and 2.8Vpp (typ. VREF = 5V), centered around VCOM. The differential outputs are summed externally: Vout = (AOUT+)-(AOUT-) between AOUT+ and AOUT-. If the summing gain is 1, the output range is 5.6Vpp (typ. VREF = 5V). The bias voltage of the external summing circuit is supplied externally. The input data format is 2's complement. The output voltage is a positive full scale for 7FFFFH(@24bit) and a negative full scale for 800000H(@24bit). The ideal AOUT is 0V for 000000H(@24bit).

The internal switched-capacitor filter and the external LPF attenuate the noise generated by the delta-sigma modulator beyond the audio passband.

Figure 19 shows an example of external LPF circuit summing the differential outputs by an op-amp. Figure 20 shows an example of differential outputs and LPF circuit example by three op-amps.

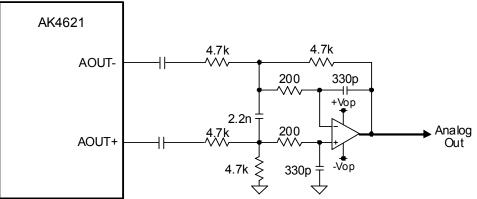

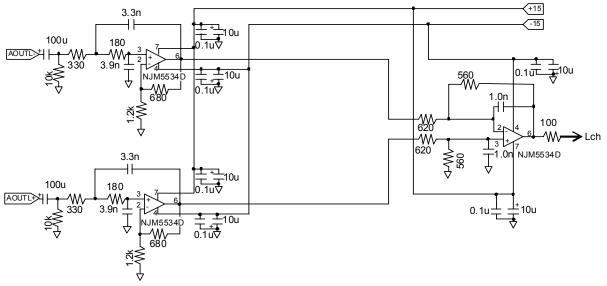

Figure 19. External LPF Circuit Example 1 (fc = 136kHz, Q=0.694)

| Frequency Response | Gain |
|--------------------|---------|
| 20kHz | -0.01dB |
| 40kHz | -0.06dB |
| 80kHz | -0.59dB |

 Table 19. Frequency Response of External LPF Circuit Example 1

| | | 1 st Stage | 2 nd Stage | Total |
|----------------|-----------------|-----------------------|-----------------------|----------|
| Cut-off Freque | ency | 182kHz | 284kHz | - |
| Q | | 0.637 | - | - |
| Gain | | +3.9dB | -0.88dB | +3.02dB |
| Frequency | 20kHz | -0.025 | -0.021 | -0.046dB |
| Response | Frequency 40kHz | | -0.085 | -0.191dB |
| Response | 80kHz | -0.517 | -0.331 | -0.848dB |

PACKAGE

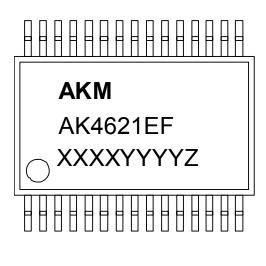

NOTE: Dimension "*" does not include mold flash.

■ Package & Lead frame material

Package molding compound: Epoxy Resin, Halogen (bromine and chlorine) free Lead frame material: Cu Alloy Lead frame surface treatment: Solder (Pb free) plate

IMPORTANT NOTICE

- These products and their specifications are subject to change without notice. When you consider any use or application of these products, please make inquiries the sales office of Asahi Kasei Microdevices Corporation (AKM) or authorized distributors as to current status of the products.
- Descriptions of external circuits, application circuits, software and other related information contained in this document are provided only to illustrate the operation and application examples of the semiconductor products. You are fully responsible for the incorporation of these external circuits, application circuits, software and other related information in the design of your equipments. AKM assumes no responsibility for any losses incurred by you or third parties arising from the use of these information herein. AKM assumes no liability for infringement of any patent, intellectual property, or other rights in the application or use of such information contained herein.
- Any export of these products, or devices or systems containing them, may require an export license or other official approval under the law and regulations of the country of export pertaining to customs and tariffs, currency exchange, or strategic materials.
- AKM products are neither intended nor authorized for use as critical components_{Note1} in any safety, life support, or other hazard related device or system_{Note2}, and AKM assumes no responsibility for such use, except for the use approved with the express written consent by Representative Director of AKM. As used here:

Note1) A critical component is one whose failure to function or perform may reasonably be expected to result, whether directly or indirectly, in the loss of the safety or effectiveness of the device or system containing it, and which must therefore meet very high standards of performance and reliability.

Note2) A hazard related device or system is one designed or intended for life support or maintenance of safety or for applications in medicine, aerospace, nuclear energy, or other fields, in which its failure to function or perform may reasonably be expected to result in loss of life or in significant injury or damage to person or property.

• It is the responsibility of the buyer or distributor of AKM products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the above content and conditions, and the buyer or distributor agrees to assume any and all responsibility and liability for and hold AKM harmless from any and all claims arising from the use of said product in the absence of such notification.
