DELPHI SERIES

Delphi S36SE, 17W 1x1 Brick Series DC/DC Power Modules: 18~75V in, 3.3V/5A out

The Delphi S36SE series, 1x1 sized, 18~75Vin, single output, isolated DC/DC converters are the latest offering from a world leader in power systems technology and manufacturing - Delta Electronics, Inc. This product family is available in either a surface mount or through-hole package and provides up to 17 watts of power or 5A of output current (3.3V and below) in a standard 1x1 form factor (1.10"x0.96"x0.33"). The pinout is compatible with the popular industry standard 1x2 sized products. With creative design technology and optimization of component placement, these converters possess outstanding electrical and thermal performance, as well as extremely high reliability under highly stressful operating conditions. The S36SE 3.3V module could provide full output power without any airflow up to 85°C ambient temperature while keeping the component junction temperatures under most derating guidelines. Typical efficiency of 3.3V/5A module is better than 86.5% and all modules are fully protected from abnormal input/output voltage, current, and temperature conditions.

FEATURES

- High efficiency: 86.5% @3.3V/5A
- Industry standard 1x1 pinout
- Size: 27.9x24.4x8.7mm (1.10"x0.96"x0.34")
- Fixed frequency operation
- 4:1 ultra wide input voltage range
- Input UVLO
- Output OCP, OVP and OTP
- Monotonic startup into normal and pre-bias loads
- Output voltage trim ±10%
- 2250V isolation and basic insulation
- No minimum load required
- SMT and Through-hole versions
- ISO 9001, TL 9000, ISO 14001, QS9000,
 OHSAS18001 certified manufacturing facility
- UL/cUL 60950-1 (US & Canada) Recognized

OPTIONS

- Positive, negative, or no On/Off
- OTP and Output OVP, OCP mode, Auto-restart (default) or latch-up
- Surface mounted pins
- Short pin lengths

APPLICATIONS

- Optical Transport
- Data Networking
- Communications, including Wireless
 and traditional Telecom
- Servers

TECHNICAL SPECIFICATIONS

 $T_A = 25$ °C, airflow rate = 300 LFM, $V_{in} = 48$ Vdc, nominal Vout unless otherwise noted.

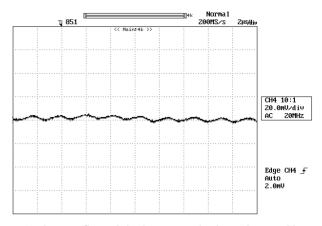

Figure 12: Input reflected ripple current, i_s, through a 12μH source inductor at nominal input voltage and rated load current (20 mA/div, 2us/div)

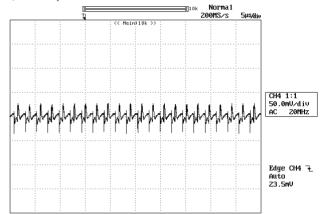

Figure 14: Output voltage ripple at nominal input voltage and rated load current (lo=5A)(50 mV/div, 5us/div).Load capacitance: 1μF ceramic capacitor and 10μF tantalum capacitor. Bandwidth: 20 MHz. Scope measurements should be made using a BNC cable (length shorter than 20 inches). Position the load between 51 mm to 76 mm (2 inches to 3 inches) from the module

DESIGN CONSIDERATIONS

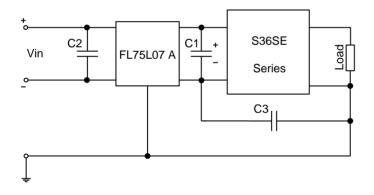

Input Source Impedance

The impedance of the input source connecting to the DC/DC power modules will interact with the modules and affect the stability. A low ac-impedance input source is recommended. If the source inductance is more than a few $\mu H,$ we advise adding a 10 to 100 μF electrolytic capacitor (ESR < 0.7 Ω at 100 kHz) mounted close to the input of the module to improve the stability.

Layout and EMC Considerations

Delta's DC/DC power modules are designed to operate in a wide variety of systems and applications. For design assistance with EMC compliance and related PWB layout issues, please contact Delta's technical support team. An external input filter module is available for easier EMC compliance design. Below is the example of using Delta latest FL75L07 A input filter tested with S36SE series to meet class B in CISSPR 22.

Schematic and Components List

C1 is 22uF/100V, low ESR Aluminum cap;

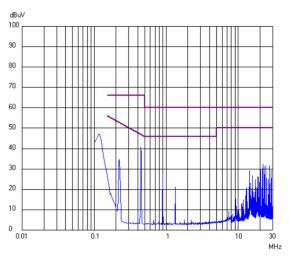

C2 is 2.2uF ceramic cap;

C3 is 22nF ceramic capacitor;

FL75L07 A is Delta input EMI filter module.

Test Result

Test result is in compliance with CISPR 22 class B, which is shown as below:

Vin=48V, Po=15W, average mode

Safety Considerations

The power module must be installed in compliance with the spacing and separation requirements of the end-user's safety agency standard, i.e., UL60950, CAN/CSA-C22.2 No. 60950-00 and EN60950: 2000 and IEC60950-1999, if the system in which the power module is to be used must meet safety agency requirements.

Basic insulation based on 75 Vdc input is provided between the input and output of the module for the purpose of applying insulation requirements when the input to this DC-to-DC converter is identified as TNV-2 or SELV. An additional evaluation is needed if the source is other than TNV-2 or SELV.

When the input source is SELV circuit, the power module meets SELV (safety extra-low voltage) requirements. If the input source is a hazardous voltage which is greater than 60 Vdc and less than or equal to 75 Vdc, for the module's output to meet SELV requirements, all of the following must be met:

- The input source must be insulated from the ac mains by reinforced or double insulation.
- The input terminals of the module are not operator accessible.
- If the metal baseplate is grounded, one Vi pin and one Vo pin shall also be grounded.
- A SELV reliability test is conducted on the system where the module is used, in combination with the module, to ensure that under a single fault, hazardous voltage does not appear at the module's output.

When installed into a Class II equipment (without grounding), spacing consideration should be given to the end-use installation, as the spacing between the module and mounting surface have not been evaluated.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

This power module is not internally fused. To achieve optimum safety and system protection, an input line fuse is highly recommended. The safety agencies require a normal-blow fuse with 5A maximum rating to be installed in the ungrounded lead. A lower rated fuse can be used based on the maximum inrush transient energy and maximum input current.

Soldering and Cleaning Considerations

Post solder cleaning is usually the final board assembly process before the board or system undergoes electrical testing. Inadequate cleaning and/or drying may lower the reliability of a power module and severely affect the finished circuit board assembly test. Adequate cleaning and/or drying is especially important for un-encapsulated and/or open frame type power modules. For assistance on appropriate soldering and cleaning procedures, please contact Delta's technical support team.

FEATURES DESCRIPTIONS

Over-Current Protection

The modules include an internal output over-current protection circuit, which will endure current limiting for an unlimited duration during output overload. If the output current exceeds the OCP set point, the modules will automatically shut down, and enter hiccup mode or latch mode, which is optional.

For hiccup mode, the module will try to restart after shutdown. If the overload condition still exists, the module will shut down again. This restart trial will continue until the overload condition is corrected.

For latch mode, the module will latch off once it shutdown. The latch is reset by either cycling the input power or by toggling the on/off signal for one second.

Over-Voltage Protection

The modules include an internal output over-voltage protection circuit, which monitors the voltage on the output terminals. If this voltage exceeds the over-voltage set point, the module will shut down, and enter in hiccup mode or latch mode, which is optional.

For hiccup mode, the module will try to restart after shutdown. If the overload condition still exists, the module will shut down again. This restart trial will continue until the over-voltage condition is corrected.

For latch mode, the module will latch off once it shutdown. The latch is reset by either cycling the input power or by toggling the on/off signal for one second.

Over-Temperature Protection

The over-temperature protection consists of circuitry that provides protection from thermal damage. If the temperature exceeds the over-temperature threshold the module will shut down, and enter in hiccup mode or latch mode, which is optional.

For auto-restart mode, the module will monitor temperature after shut down. Once the temperature is within the specification, the module will be auto-restarted.

For latch mode, the module will latch off once it shutdown. The latch is reset by either cycling the input power or by toggling the on/off signal for one second.

Remote On/Off

The remote on/off feature on the module can be either negative or positive logic. Negative logic turns the module on during a logic low and off during a logic high. Positive logic turns the modules on during a logic high and off during a logic low.

Remote on/off can be controlled by an external switch between the on/off terminal and the Vi(-) terminal. The switch can be an open collector or open drain.

For negative logic if the remote on/off feature is not used, please short the on/off pin to Vi(-). For positive logic if the remote on/off feature is not used, please leave the on/off pin floating.

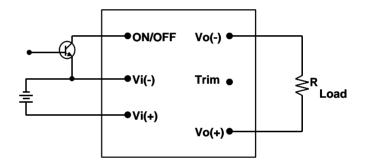

Figure 16: Remote on/off implementation

FEATURES DESCRIPTIONS (CON.)

Output Voltage Adjustment

To increase or decrease the output voltage set point, the modules may be connected with an external resistor between the TRIM pin and either the Vo(+) or Vo(-). The TRIM pin should be left open if this feature is not used.

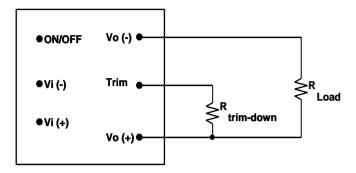

Figure 17: Circuit configuration for trim-down (decrease output voltage)

If the external resistor is connected between the TRIM and Vo(+) pins, the output voltage set point decreases (Fig. 17). The external resistor value required to obtain an output voltage change from 3.3V to the desired Vo_adj is defined as:

Rtrim_down=
$$\frac{(\text{Vo}_adj - 2.5) \cdot 5110}{3.3 - \text{Vo}_adj} - 2050$$

Ex. When Trim-down -10%

Vo_adj=3.3Vx(1-10%)=2.97V

Rtrim_down=
$$\frac{(2.97-2.5)\cdot5110}{3.3-2.97} - 2050$$

Rtri m_down =
$$5.228 \times 10^3$$
 ohm

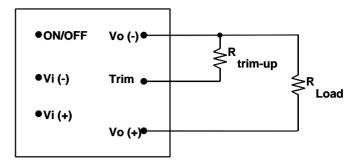

Figure 18: Circuit configuration for trim-up (increase output voltage)

If the external resistor is connected between the TRIM and Vo(-) the output voltage set point increases (Fig. 18). The external resistor value required to obtain an output voltage change from 3.3V to the desired Vo_adj is defined as:

Rtrim_up=
$$\frac{2.55110}{\text{Vo_adj} - 3.3} - 2050$$

Ex. When Trim-up +10%

Vo adj=3.3Vx(1+10%)=3.63V

Rtrim_up=
$$\frac{2.55110}{3.63-3.3} - 205$$

Rtri m_up =
$$3.666 \times 10^4$$
 ohm

When using trim function, the output voltage of the module is usually increased, which increases the power output of the module with the same output current.

Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

THERMAL CONSIDERATIONS

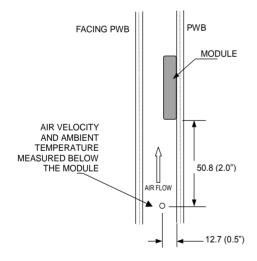

Thermal management is an important part of the system design. To ensure proper, reliable operation, sufficient cooling of the power module is needed over the entire temperature range of the module. Convection cooling is usually the dominant mode of heat transfer.

Hence, the choice of equipment to characterize the thermal performance of the power module is a wind tunnel.

Thermal Testing Setup

Delta's DC/DC power modules are characterized in heated vertical wind tunnels that simulate the thermal environments encountered in most electronics equipment. This type of equipment commonly uses vertically mounted circuit cards in cabinet racks in which the power modules are mounted.

The following figure shows the wind tunnel characterization setup. The power module is mounted on a test PWB and is vertically positioned within the wind tunnel. The space between the neighboring PWB and the top of the power module is constantly kept at 6.35mm (0.25").

Note: Wind Tunnel Test Setup Figure Dimensions are in millimeters and (Inches)

Figure 19: Wind tunnel test setup

Thermal Derating

Heat can be removed by increasing airflow over the module. To enhance system reliability, the power module should always be operated below the maximum operating temperature. If the temperature exceeds the maximum module temperature, reliability of the unit may be affected.
