74VHC574FT

1. Functional Description

- Octal D-Type Flip Flop with 3-State Outputs

2. General

The 74VHC574FT is an advanced high speed CMOS OCTAL FLIP-FLOP with 3-STATE OUTPUT fabricated with silicon gate C^2MOS technology.

It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation.

This 8-bit D-type flip-flop is controlled by a clock input (CK) and an output enable input ($\overline{OE}$).

When the $\overline{OE}$ input is high, the eight outputs are in a high impedance state.

An input protection circuit ensures that 0 to 5.5 V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5 V to 3 V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

3. Features

(1) High speed: f_{MAX} = 180 MHz (typ.) at V_{CC} = 5 V

(2) Low power dissipation: I_{CC} = 4 μA (max) at T_a = 25°C

(3) High noise immunity: $V_{NIH} = V_{NIL}$ = 28% V_{CC} (min)

(4) Power-down protection is provided on all inputs.

(5) Balanced propagation delays: $t_{PLH} \approx t_{PHL}$

(6) Wide operating voltage range: $V_{CC(opr)}$ = 2 V to 5.5 V

(7) Low noise: V_{OLP} = 1.0 V (max)

(8) Pin and function compatible with the 74 series (74AC/HC/AHC/LV etc.) 574 type.

Note: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.
Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.
Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

$I_{CC(opr)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}/8$ (per F/F)

And the total C_{PD} when n pcs of F/F operate can be gained by the following equation.

C_{PD} (total) = 20 + 8 × n
