# Low Charge Injection, 8-Channel, Enhanced, High Voltage Analog Switch 

## Features

- HVCMOS technology for high performance
- 8 Channels of high voltage analog switch
- 3.3 or 5.0 V CMOS input logic level
- 20MHz data shift clock frequency
- Very low quiescent power dissipation (-10 A )
- Low parasitic capacitance
- DC to 50 MHz analog signal frequency
- -60 dB typical off-isolation at 5.0 MHz
- CMOS logic circuitry for low power
- Excellent noise immunity
- Cascadable serial data register with latches
- Flexible operating supply voltages

## Applications

- Medical ultrasound imaging
- NDT metal flaw detection
- Piezoelectric transducer drivers
- Inkjet printer heads
- Optical MEMS modules

## General Description

The Supertex HV2201 is a low charge injection, 8-channel, high voltage analog switch integrated circuit (IC). The device can be used in applications requiring high voltage switching controlled by low voltage control signals, such as medical ultrasound imaging, piezoelectric transducer drivers, and printers. The HV2201 is an enhanced version of the HV20220.

Input data is shifted into an 8 -bit shift register that can then be retained in an 8 -bit latch. To reduce any possible clock feedthrough noise, the latch enable bar should be left high until all bits are clocked in. Data is clocked in during the rising edge of the clock. Using HVCMOS technology, this device combines high voltage bilateral DMOS switches and low power CMOS logic to provide efficient control of high voltage analog signals.

The device is suitable for various combinations of high voltage supplies, e.g., $\mathrm{V}_{\mathrm{PP}} / \mathrm{V}_{\text {NN }}:+40 \mathrm{~V} /-160 \mathrm{~V},+100 \mathrm{~V} /-100 \mathrm{~V}$, and $+160 \mathrm{~V} /-$ 40 V .

## Block Diagram

Ordering Information

| Device | Package Options |  |
| :---: | :---: | :---: |

Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| $\mathrm{V}_{\mathrm{DD}}$ logic supply | -0.5 V to +7.0 V |
| $\mathrm{~V}_{\mathrm{PP}}-\mathrm{V}_{\mathrm{NN}}$ differential supply | 220 V |
| $\mathrm{~V}_{\mathrm{PP}}$ positive supply | -0.5 V to $\mathrm{V}_{\mathrm{NN}}+200 \mathrm{~V}$ |
| $\mathrm{~V}_{\mathrm{NN}}$ negative supply | +0.5 V to -200 V |
| Logic input voltage | -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ |
| Analog signal range | $\mathrm{V}_{\mathrm{NN}}$ to $\mathrm{V}_{\mathrm{PP}}$ |
| Peak analog signal current/channel | 3.0 A |
| Storage temperature | $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ |
| Power dissipation: |  |
| 48-Lead LQFP | 1.0 W |
| 28-Lead PLCC | 1.2 W |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## Operating Conditions

| Sym | Parameter | Value |
| :---: | :--- | ---: |
| $\mathrm{V}_{\mathrm{DD}}$ | Logic power supply voltage | 3.0 V to 5.5 V |
| $\mathrm{~V}_{\mathrm{PP}}$ | Positive high voltage supply | 40 V to $\mathrm{V}_{\mathrm{NN}}+200 \mathrm{~V}$ |
| $\mathrm{~V}_{\mathrm{NN}}$ | Negative high voltage supply | -40 V to -160 V |
| $\mathrm{~V}_{\text {IH }}$ | High level input voltage | $0.9 \mathrm{~V}_{\mathrm{DD}}$ to $\mathrm{V}_{\mathrm{DD}}$ |
| $\mathrm{V}_{\mathrm{IL}}$ | Low-level input voltage | 0 V to $0.1 \mathrm{~V}_{\mathrm{DD}}$ |
| $\mathrm{V}_{\text {SIG }}$ | Analog signal voltage <br> peak-to-peak | $\mathrm{V}_{\mathrm{NN}}+10 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{PP}}-10 \mathrm{~V}$ |
| $\mathrm{~T}_{\mathrm{A}}$ | Operating free air temperature | $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$ |

Notes:

1. Power up/down sequence is arbtrary except GND must be powered-up first and powered-down last.
2. $V_{S I G}$ must be $V_{N N} \leq V_{S I G} \leq V_{P P}$ or floating during power up/down transition.
3. Rise and fall times of power supplies $V_{D D}, V_{P P}$ and $V_{N N}$ should not be less than 1.0 msec .

## Notes:

1. The eight switches operate independently.
2. Serial data is clocked in on the $L$ to $H$ transition of the CLK.
3. The switches go to a state retaining their present condition at the rising edge of $\overline{L E}$. When $\overline{L E}$ is low the shift register data flow through the latch.
4. $D_{\text {out }}$ is high when data in the shift register 7 is high.
5. Shift register clocking has no effect on the switch states if $\overline{L E}$ is high.
6. The CLR clear input overrides all other inputs.
